Cross-posted to: alt.radio.scanner,rec.radio.scanner

I was wondering if anyone might know how to pick up the Colts games?
Someone told me that it's possible to pick up the radio station WIBC in
Indianapolis which broadcasts the games...anybody know of their freq or
of any other freq where I could hear the games?

BTW, WIBC is 1070 AM if that helps any.

Thanks much in advance!!

I know one's $60, one's $30 (at RS), but I just got my 2006 and wanted to know if I'm gonna have ALOT greater performance using a Discone over an All-band or just so-so/about the same... I do want something that'll work well for all my scanner's bands but don't wanna pay $60 when I could pay $30... ya know? :-)

Thanks ALL!

It might be on the roof of the building your in.
You said your on the 16th floor,, how many more to the top?
It might not even be a 800-900 MHz trasnmitter. It could be a frequency that the rubber duck is better tuned for and overloading the front end that way.
Who knows, it just might be a heavy trunk system up on the roof.

From: fa419@cleveland.Freenet.Edu
Message-ID: <3426a8$f76@usenet.INS.CWRU.Edu>
Source record: 269715

I'd like to hear from anyone who has the Opto 456/Pro 2006 combination
regarding what the software can make the scanner do. Specifically,
Can you lock out certain frequencies within a search range? (*Not
preprogrammed channels, but actual freqs*)
Can you tape record the content of frequencies that get logged?
Could a lowly '88 run this system? (*a good use for such a machine*)
How useful is the software that comes bundled with it?
How useful/expensive are the Scan Cat/Scan Cat Pro packages?
Can I write software to manipulate the little beast?
What do you really like about it? What do you hate?

Thanks in my pants! =:} (*blush*) I mean 'in advance'!

1402. Re: Freq for portland oregon

Message-ID: <CvEnKs.KCG@ibeam.intel.com>
Source record: 269741
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Having also been unable to positively any TACII switchover, I'd speculate that possibly it is simplex? Various net.gurus have mentioned such usage for tactical frequencies in LA and other areas.

Anyway, to address the current request, PPD had licensed at last check:
856/57/58/59/60 .2625/.4375/.4625/.7125/.7375
note that TACII could also be an interagency, and maybe police call has it listed under a different local agency. Washington County Sheriff recently moved from 460 .375/.150/.525 up to the 800 trunked band. An acquaintance (nm7b) relates that they have started sharing a system with Beaverton, Hillsboro, and possibly Tigard.

To: INTERNET--IBMMAIL

From: Matt Loiselle
Subject: Non-US Frequency Allocations?

I'm looking for information on the frequency allocations in Europe, Japan, and middle eastern countries such as Saudi Arabia.

Something similar to the US CFR 47 would be ideal. I'm interested in band usage and maximum allowed effective radiated powers and possibly min/max antenna heights.

Does anyone know where I might find this information either in book form or possibly on CD-ROM or some other medium?

Thanks!!

>Can you lock out certain frequencies within a search range? (*Not

Yes.

>preprogrammed channels, but actual freqs*)
>Can you tape record the content of frequencies that get logged?

Yes, but without any data of which channel the audio came from. The
radio has recorder stop/start and audio outputs.

>Could a lowly '88 run this system? (*a good use for such a machine*)

Yes. I have it running on an old V20-equipped laptop.

>How useful is the software that comes bundled with it?

Plenty useful, you just have to drive through all the menu options and
figure out what each does. The documentation is, um, limited.

>How useful/expensive are the Scan Cat/Scan Cat Pro packages?

Have not seen.

>Can I write software to manipulate the little beast?

The command set is based on Icom's CI-V protocol. If you ask Optoscan
they will send you a complete command set. It's pretty straightforward,
with all transactions between the computer and the 456-equipped radio
over a serial pair.

>What do you really like about it? What do you hate?

I really like the whole product. It works fine. What I hate is that
the software, while it does everything I've thought of that it should
do, is cumbersome to get around in. For instance, you will learn that
you can name a given channel/PL combination so that the name comes up
when the channel is active. That's really neat, but I found it by
accident. You can learn to make it do whatever you want, but it just
takes running through the software a lot and writing down the map as
you go. The only big limitation for me is that the DTMF buffer on the
board limits DTMF decoding to a string of about 100 digits. If you
want to download parameters from a repeater via DTMF, for instance,
you have to figure out a kludge to break up a long string into smaller
ones.

The "professional" version of the software is more money. You can download a version of it from the author's bbs, that is fully functional but for only 30 minutes per run. It offers a graphics display spectrum analyzer, and logs signal strength along with the channel data (the version shipped with the unit displays signal strength but does not log it). There are also some more flexible search/scan modes but I have not needed them. I have been unable to get a response from the author on some minor bugs and changes that I wanted done, even though we are within a few miles of each other.

The installation instructions are very clear but don't work in one critical area. They provide mini-hooks to clip on a couple of critical points in the radio to bring out signals. The points on the radio aren't big enough to be clipped to, unless the radio is never moved (the clip falls off if you move it). Solution, discard the clips and solder the wires on, carefully. Takes 1 minute.

Summary: great product, the included software works fine once you learn it, lousy software support.

>[All the above still considered 911 however. Zenith 12000 might be in
>there too... possibly as interagency]

Today if you call a landline ("0") operator and ask for Zenith 12000 or the Highway Patrol you will be instructed to call 911. They seem to rely on interagency transfers now.

BTW - using a direct number to the CHP dispatcher, rather than 911, would get you a dispatcher line that cannot be transfered. I have run into this with amateur autopatching that has a direct, 7 digit CHP number programmed. This may have been unique to the Golden Gate dispatch center in Vallejo and may have been changed - 911 on my cell phone is my first choice for mobile emergencies.

I am clearing out some extra scanner books that're cluttering up my shack:

1: LOW BAND SKIP DIRECTORY by Chuck Robertson published by Grove Enterprises
interesting reference to 29.7 - 50.0 MHz frequencies that can be heard
in North America from the Caribbean, Central & South America ans Europe.
Also contains a frequency cross-reference. $5.00 + postage

2: SCANNER RADIO LISTINGS by Norman H. Schrein, MPA published by FOX
regional guide covering IL, IN, KY, MI, OH and WI. Includes Police,
Fire, Ambulance & Rescue, Local Gov'ts, Forestry, Marine, Mobile Phone,
Aircraft, NOAA Weather, and more. Also included Frequency spectrum
charts. $5.00 + postage

If interested reply by e-mail

1419. FOR SALE: 460-464 & 480-484 MHz receiving converter for 2m HT

Newsgroup: rec.radio.scanner
Date: 1994-08-31 20:51:42 UTC
From: mc@shore.shore.net
Message-ID: <342qgu$jdq@shore.shore.net>
Source record: 269757
Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.swap

FOR SALE: UHF - Public Safety band receiving converter:

Converts 460 - 464 MHz and 480 - 484 MHz Public Safety Band to 144 - 148 MHz which works with a scanning amateur radio 2 meter handie-talkie, mobile or base radio to allow you to listen to the UHF bands. Does not convert on transmit. Designed for use on a 2 meter HT, it has a BNC connector on the bottom that attaches to the HT and another BNC on the top that attaches to the antenna. A three-position switch switches the unit off and selects which band will be converted. Coverage will be expanded on units that scan above and below the 2 meter band. The unit is made by M Squared Electronics and is not to be confused with a cheaper unit that is similar made by a well-known manufacturer of cheap ham and swl accessories. I just installed a brand new battery (AAA). Will sell for $30.00 plus UPS.

If interested please reply by e-mail.

I don't know where your Exxon is, but I'm guessing
Elizabeth/Rahway.

NJSP North 860-856.4625 and 860-856.9625. That is, 860.4625MHz,
859.4625MHz, and so on through 856.4625MHz and the same for
.9625. These channels are special in that two of them will
have a very annoying, loud signal on it while the others will
be various voice communications. Lock out the annoying one,
but don't forget about it. The sound moves from channel to
channel, usually precisely at midnight.. take my word for it,
don't go to sleep before midnight with the scanner on these
freqs!

Statewide Intersystem (multiagency chases) 154.680
Elizabeth PD 154.860
Newark PD 460.125 460.15 460.175 460.2
Newark FD 154.13
Rahway/Linden PD 453.275
Roselle Park 159.21
Hillside 154.845
Union Twp 155.055
Union County 460.100 (sheriff and intracounty multiagency chase)

: Great Glen. You FOIA'd 8 year old stuff the statute of limitations has run
: out on. Good job.

I foia'd that years ago. A couple of times, in fact. They changed one
word that was originally classified SECRET to classifieds only CLASSIFIED.
I have other files from them (on me) dating back to 1978.

Anyways, that was they presentation, not mine. Other than the snipe in
there
claimed I was going to inform their target of the surveillance, they didn't
accuse me of any wrong doing.

However, the Justice Department took that complaint much more seriously
than the Ann Arbor Police (of course the FBI blacked out in that memo
was it was I claimed they did).... which was place a threatening phone
call to me. (In fact, it is against written FBI policy that they have
ANY contact with the Press without prior approval from the Attorney
General).

The Justice Department make the agent who placed the phone call prepare
a (3 page) writen affidavit and submit to an oral interview. He was
required (under threat of termination of the FBI) to waive his Privacy
Act and 5th Amendment Rights (I have a copy of the waiver) as a part of
the oral interview. What, was NEVER released under the FOIA was ANY
hint of the outcome of that interview or the Justice Department
inquiry. It is the WRITTEN POLICY of the FBI to DENY any allegations
of wrong doing by their agents. They never DENIED my allegations. In
fact, they never publically addresses them in any manner what-so-ever.

The response to Congressman Pursell by the Special Staff of the intelligence
division was a two paragraph general statement about covert FBI operations.
Of course, they also attached an additional memo classified SECRET,
so Congressman Pursell couldn't give me their whole reply. I didn't know
about that until I got it under the FOIA.

The incident did have a noticable impact on the FBI agents, in that they
made an obvious point of avoiding me on the street.

(It help to know that my contact at that time was nearly daily, as their office was in the same building as my PO Box... in fact, some of the postal clerks asked me why the FBI agents were always running around with basket-ball-bags).

Thanks Andy and Aldrin for the responses. I chose the All-Band over the Discone- it IS a monster but I managed (after a day's work! :-) to get it up in my attic!

Folks, if you're wondering- the All-Band antenna is a great $30 purchase! I'm picking up almost toooo much- I'm new to scanning, I heard about "ghost" signals or whatever, where what you're hearing really isn't on that freq but you're hearing it there anyway- I think I'm now getting a few of those. Oh well... I'm still much happier!

1430. Help wanted: Regency 1040 Scanner

Newsgroup: rec.radio.scanner
Date: 1994-09-01 00:32:51 UTC
From: rbn@apple.com
Message-ID: <3437fj$hg3@apple.com>
Source record: 269773
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I recently picked up a Regency 1040 scanner at a good price. The radio is in excellent condition pysically, and accepts frequencies into the VFO without incident. When I select a channel (one of ten) to hold the frequency, the radio responds as if the frequency has in fact been stored in that frequency.

If I switch to SCAN mode, the radio will not lock up on the stored frequency... it appears the frequency did not get written to channel RAM. Before opening up the radio, I'm hoping someone with a schematic (or working knowledge of this radio) can answer the following question: Is the RAM an integral part of the CPU in this radio, or is there a separate RAM chip (and if there is, where is it and what type of chip is it)? I'm assuming the RAM (for channel storage, not VFO or 'scratch') is not part of the CPU, since the CPU seems to be working just fine otherwise.

Help!

RadioMap - A New Way to Find, Identify, and
Visualize Licensed Transmitter Sites

by Bob Parnass, AJ9S

As a radio hobbyist, I've spent a lot of time trying to identify the radio antennas and antenna towers I see in my travels around the Midwest. The FCC microfiche is helpful but the information on file with the FCC is often misleading. Transmitter sites are frequently incorrect or vague.

To help identify antenna towers, I invented a computer based process which makes a color map showing the FCC licensed transmitter sites within a given area. I call this a "RadioMap."

If you attended the August Chicago Area Radio Monitoring Association meeting, you saw a RadioMap.

There are no streets, rivers, or ham radio stations shown on a RadioMap, as they would clutter the map. Instead, there are range markings every mile and North/South and East/West axes. The latitude and longitude of the map center is clearly marked. Fixed stations shown include business, public safety, cellular phone cell sites, state and local governments, industrial, etc. -- from VLF through microwave frequencies. Fixed station locations are marked, and callsign, frequency, and licensee name are listed.

The maps look professional and can be laminated or framed. (A RadioMap of my community hangs in an oak frame.)

After drawing my first RadioMap, I was able to identify a neighborhood microwave tower which had been a mystery since I moved to Kendall County in 1985. I had been searching the fiche for Oswego transmitter sites, but the mystery transmitter location filed with the FCC was listed as Aurora. The actual site is in Oswego Township in unincorporated Kendall County! I found other examples of this as I refined the RadioMap production process.

Given a center location and a range (in miles), I will create a custom RadioMap for you. At this time, I can make maps only for locations in:

Illinois, Indiana, Michigan, New York, and Wisconsin

You can find the licensed transmitter sites in your neighborhood, near your office, or anywhere else within the 5 states.

For the last 10 years, I have shared my frequency information with others for free. More recently, I have given away free RadioMaps, but it takes between 30 minutes to 1 hour to produce a single RadioMap. I can only provide them now if I can cover my material costs and time by charging $17 per RadioMap.

Send me:

1. Self addressed stamped envelope (at least 4-1/8 x 9-1/2")
2. $17 (personal checks subject to 2 week delay until check clears)
3. Your latitude and longitude, down to the nearest one second, e.g., 41 41 15 North latitude, 88 18 33 West longitude. I will center the RadioMap at this point. If you don't know the latitude and longitude, specify the city, and nearest street intersection, e.g., intersection of Ogden Avenue and Mill Street in Naperville.
4. Desired range of the RadioMap, in miles, from the center point. I will have to readjust the range downwards if your RadioMap is too crowded. A range of 2 miles or less works best in areas with a lot of transmitters (within Chicago). In rural areas, RadioMaps with a 5 mile range are often possible.
5. Your evening telephone number so I can call you if I cannot read your writing or have other questions.

Using fresh FCC data less than one year old, I will produce and send you (using your SASE) a custom, color 8-1/2 by 11" RadioMap and a list of licensees including callsigns.

Bob Parnass, AJ9S (RCMA IL-267)
2350 Douglas Road, Oswego, Illinois 60543

evening telephone (708)554-3839.
No calls after 10 PM Central Time, please.

IMPORTANT NOTE: Please do NOT send me email about this or phone my office during the day as this is an off-hours hobby project. Thanks!

PS - I cannot provide the RadioMap software.

This thread makes me wonder where the distinction lies between an advertisement and a brochure. How about this for starters:

If one advertises, one enlists someone to carry and deliver the message.

I may have millions of brochures printed and not be advertising by this definition. If I pass them out at a trade show maybe I am on the grey line? Maybe not.

>
>Andy
>

I guess if they advertise the device in a Law Enforcement Journal, then they feel like it is OK as the potential buyers are potentially legally entitled to buy and use such equipment. I suspect the law probably does not make such a distinction, but it may be that this is the logic being used.

The outrageous aspect of this is that if it is advertised in a law enforcement journal that here is a company wantonly breaking the law in the presence of thousands of people charged with enforcing the law. Of course we know how many of this class actually *break* the law and do so wantonly and frequently. (ever seen a cop put on his light bar to make an illegal turn and follow him directly into the nearest Dunkin Donuts?)

Now why do you think that they cannot ignore it? Newspapers have
no sworn obligation to do anything. They are accountable to no one
for their content. They can and do decide on a daily basis what does
and does not get printed. They can set Liberal, Conservative, or
balanced "agendas" and always make political endorsements on election
day.

Hey Glen, How about looking into Whitewater next? Maybe you will turn up
something (there must be an abundance of incriminating information out
there judging by how much the Clintoons are denying)? But be careful:
if you get too close you will come down with that nasty "Arkansas Disease"
(=suicide=good old russian "lead poisoning") Foster, the guy that testified
against Jocelyn Elders son, the wife of Trooper Ferguson, etc.

Does anyone know how to get the Pro 43 into test mode?I was told this was possible by pressing a few keys before turning it on.The pin head at radio shack woulden't tell me how but said I could find it in M.T.the current issue doesn't say anything.

What does the test mode do??

Please e-mail me or post.
Thanks in advance,NCS.

If you have a local dialup node into Netcom, you get unlimited connect
time each month. Much better deal than AOL.

alt.radio.scanner does often have a different flavor than the rec.radio.scanner.
More in keeping with the alt.xxx philosophy of being a maverick.

Oh, fine. I bought one based on the date code -- it says 3A4. However the
serial number has an "A" prefix. I haven't tried the mod yet.

by the way, that "Monitoring Times" article you quoted missed the 54-88
restore mod.

1452. FCC License Data Sources

Newsgroup: rec.radio.scanner
Date: 1994-09-01 07:00:22 UTC
From: bill@thd.tv.tek.com
Message-ID: <343u66$mjk@news.tv.tek.com>
Source record: 269623
Cross-posted to: rec.radio.scanner,rec.radio.info

[last changed 05-Jul-94]

Changes preceeded by "|". Please e-mail corrections and additions to me.

INTRODUCTION

This is a list of FCC license data sources available to scanner listeners. The FCC master contains a wealth of data about every non-government license in the United States. Most of the sources below contain a subset of this data, although a few contain all of it. Government licenses are not administered by the FCC, and the data is not available to the public.

If you are interested in purchasing the data, you might want to consider forming a co-op of people in your area to share the cost. As far as I know, this is legal since the information is in the public domain. However, most software supplied to view or manipulate the data is copyrighted and must be purchased separately by each user.

Prices are rounded to the nearest dollar and include shipping, if known.

C.E.T.

CET sells records of all stations inside a 30-mile radius for $80. (Major cities cost extra.) A 70-mile search costs $178. The data is provided on floppy disks and is available in ASCII columnar and comma-delimited formats.

CET does not provide data for licenses that do not contain specific geographic coordinates (i.e., mobile-only systems) or specific operating frequencies (e.g., amateur radio).

To do the search, CET requires the latitude and longitude of the center of the 30-mile radius. I calculated mine from a USGS topographic map I obtained at a local nautical supply store. Alternatively, you can obtain the coordinates for your town from the University of Michigan's geographic name server. Run "telnet 141.212.99.9 3000" and enter your zip code. For my area, the server returned the coordinates of the main post office.

CET can be reached at 800-445-0297.

GROVE

Grove sells FCC data on disk by state. The first state is $40, and each additional state is $30 (add $10 for CA, FL, TX). The disk comes with a database search program. Grove Enterprises can be reached at 800-438-8155.

MICROFICHE

The Bearcat Radio Club sells the FCC master by state for $15. Bearcat Radio Club can be reached at P.O. Box 291918, Kettering OH, 45429.

PERCON

PerCon sells a variety of FCC data on CD-ROM and floppy. CD-ROMs are available by region or category, and floppies are available by state. Also available is a CD-ROM of the entire US (2.5 million records). Data is updated approximately every six months.

State floppies are $60 per state (add $5 for CA, FL, NY, TX, PA, OH, IL). Regional and full US CD-ROMs are $105 each. CD ROMs by category are $155 each. Quantity discounts available. PerCon can be reached at 716-386-6015.

POLICE CALL

This is probably the most cost-effective source of public service license information. The detail is limited, but the information that is there is often more useful than the FCC master. For example, an entry in Police Call that reads, "Portland Police, Net 3, North Precinct," reads, "Portland, City of" in the master.

Police call is available in 9 volumes covering different regions of the US. It can be purchased at Radio Shack stores for $10 per volume.

SCANWARE ASSOCIATES

ScanWare Associates sells a PC-based database program called the FCC Frequency Retrieval System V2.0. It comes with FCC data for one state, covering all services from 10 kHz through 2036 MHz. Data is updated approximately every six months (last update was Dec. 1, 1993).

Cost is $35 for the first state and $20 for each additional state. (Add $5 for CA, FL, TX, NY.) Quantity discounts available. Fully working shareware copy downloadable from their BBS at 206-871-4228 (FCC200.ZIP). ScanWare Associates can be reached at 206-698-1383 (voice) or 206-698-8207 (fax).

It probably was a franchise store owner worried about being left with a
bunch of "illegal" scanners who blew them out for $199. You see these
guys at hamfests all the time, even here in Iowa. You'd do best checking
with franchise stores (those not owned by Tandy), because they can set
their own prices independent of Tandy's price lists.

> your exception? :-)
>
> -- Dave

No. I think this thread has established that there was a PRO-43 production change, which resulted in a change of the FCC-ID code, as well as a new sequence of serial numbers, starting with the letter *A*.

I don't know that we have established the exact date that the change took place. It has been suggested, but not verified, that units with date codes of 3A4 (March, 1994), are modifiable.

It has also been reported, but not verified, that units with the *A* suffix in the FCC-ID code, and the *A* prefix in the serial number, and also, _possibly_, date codes of 4A4 (April, 1994) or later, are _NOT_ modifiable.

Your report seems to indicate that the production change took place earlier than 4A4, perhaps 3A4 (or even earlier?).

David, I think it is your duty to go back to your local Radio Shack store, buy the unit, try the mod, and report back to the group whether you were successful or not.

Keep us posted!

1456. PRO-2004 w/HB-232 For Sale

Newsgroup: rec.radio.scanner
Date: 1994-09-01 08:42:51 UTC
From: KeithR@PrimeNet.COM
Message-ID: <CvG07F.76@primenet.com>
Source record: 269589

==========

FOR SALE: RADIO SHACK PRO-2004 SCANNER w/HB-232 CPU INTERFACE

Features: 400-Channel, Cellular Restore and Speed Up Mods.
25-1300 MHZ, Wide Band FM, AM, Narrow FM, Sound Squelch

Includes: Commtronics HB-232 Computer Interface installed with
MS-DOS software. Small phone jack connection on rear
panel for serial interface. Adapter cable to convert
to IBM 25-pin connector provided.

Includes: Service Manual, Whip Antenna.

Modified: Removed power transformer per recommendations
for less heat buildup. External wall adapter
included. Old xformer provided if needed.

Price: $350 COD, Includes UPS Blue Shipping

If interest in any of these radios, please E-Mail me your address or
call (602) 835-2243, my work number, between 8:30 AM and 3:00 PM
Monday - Friday and ask for Keith and say it is about the scanners.
My secretary won't let you through otherwise.

Am needing info on ICOM IC-2SRA mods. This is strange ham/scanning
ht covers 25-950 mHz on on side, but only ham 2m and pubservic
vhf-hiband on other, and seems to be programmed internally for
operating range using a diode matrix, but schematic shows none of
the connections between the matrix and the processor or pll.
hmmmmmm.
Tanks, folks

The ECPA stated that April was the cutoff date and it seems that
everyone is assuming that the non-mod units *must* begin with 4A4 date
code. But who is to say *when* the manufacture actually ceased making
the modifiable units? It could have been earlier than April. Does
anyone really know for sure? Let's see some concrete evidence here.

I own the ATT 9100,actually the speakerphone version of it. Voice quality is excellent-no one can tell which phone I'm using. It is wider than a normal handset (and my hands are small) but I got used to it quickly. I haven't tested the range, but it should do at least 500 feet; it has a neat feature in that the phones poll each other even when in standby, and will beep to let you know you've gone out of range. My only complaint (and it's not something that comes up often) is that there are only ten memories (plenty for me) and a twelve (I think) digit limit per memory; If you want to automate dialing into phone mail, dialing your box code and password, you'll likely have to use two memories.

ICOM IC-R7000 RECEIVER ANTHOLOGY

Compiled by Bob Parnass, AJ9S

EXAMINING THE ICOM IC-R7000 RECEIVER

Bob Parnass, AJ9S

The long awaited ICOM R7000 is here. I bought my R7000
(S/N 001400) on June 14, 1986 from Spectronics, and
agree with other R7000 owners: ICOM did their homework
on this radio.

I had several questions about the R7000 that were not
answered in ICOM's advertisements, and could only be
answered by fiddling with the real thing:

1. Can one set the R7000 to behave like a "normal"
scanner, waiting for a transmission to complete
before resuming the scan? Contrary to the review
in July Monitoring Times, the answer is YES.
There are 4 choices of when to resume scanning
(or seaching), and this is one of them.

2. Does the R7000 have a "search and store" mode,
like the old Bearcat 250? Yes, and it's well
done. There is a mode which will search between
two frequency limits, and store the active fre-
quencies in the top 20 channels. The R7000 is
smart enough not to store duplicate frequencies.

3. Does the R7000 use the concept of a "channel
bank"? Yes, one can select and deselect any of
the 99 channels to be in a bank. This is much
more flexible than traditional scanners. For
example, the user can form a bank composed of
channels 2, 5, 31, 48, and 79.

4. Does the Priority Scan feature work like a Bear-
cat scanner? Well, sort of. The best way to
describe the ICOM R7000 priority algorithm is to
say is resembles using a Bearcat scanner in the
manual mode with the priority feature selected.
One cannot "scan" more than one channel on the
7000 while sampling the priority channel. On the
plus side, the priority frequency does not use up
any of the 99 channels, but is programmed from
the keyboard and has its own register. The user
can use the "scan speed" control to set how often

the priority frequency is sampled, a nice touch.
In practice, the R7000 dwells on the priority
frequency for a little too long, essentially
chopping up the signal on the non priority fre-
quency too much.

Using the internal, top-mounted speaker, the R7000 has
good audio power and fidelity, better than my R71A.

The user manual is generally good, and a schematic is
furnished. Some broken English makes it unclear as to
whether the R7000 battery backed up RAM contains
firmware as in the R71A.

There are provisions for activating a tape recorder
when a signal is received, but there is about a 1
second delay in activation, causing the recorder to
miss the start of the transmission. I may replace the
capacitor in that relay circuit when I get the nerve to
open the cabinet for the first time.

Another relay is used to switch in some filters for
reception above 512 MHz, so one hears the relay click-
ing while scanning a mixture of low and high frequen-
cies, a bit unnerving.

There's a lot of fun to be had with the R7000. It was
interesting tuning through the link and paging signals
in the 72-76 MHz band, and listening to military air-
craft in the 200-400 MHz band.

My UHF antenna system consists of a government surplus
FAA discone, good for coverage between 150-1200 MHz.
Although not as good as a Butternut SC3000 antenna in
the 150-174 and 440-512 MHz ranges, the discone has the
edge in the 225-400 and 512-1200 MHz bands. At these
frequencies, a low loss feedline is very important, and
I use a Belden 9913 clone made by International Wire
and Cable.

COOL YOUR ICOM R7000 RECEIVER WITH ANOTHER HEAT SINK

Bob Parnass, AJ9S

The new ICOM R7000 25-2000 MHz receiver is a super radio, but the power supply tends to run hot. The two biggest heat generators are the pass transistor and bridge rectifier module. The stock heat sink, a flat piece of metal bolted to the inside of the cabinet rear, is inadequate. After 30 minutes of use, the back panel gets very hot, and the entire cabinet warms.

I added a small heat sink to the outside of my radio, using the screw that holds the bridge rectifer to the stock heat sink. An application of heat conductive grease between the added sink and the cabinet helps the heat transfer process. Now the rest of the cabinet gets barely warm to the touch.

- 4 -

ADD A COOLING FAN TO YOUR ICOM R-7000 RECEIVER

by Brian Kantor, WB6CYT1

In my R-7000, adding a fan makes a big difference. I've had it on continuously for three days now, and it's still nice and cool. Turns out most of the heat comes from the transformer core in the AC supply. One of those 3-1/2" 12V DC fans fits just nicely - a pair of 1/4" standoffs screwed through two of the upper back panel ventilation slots holds it in place, the power leads snake through the lower ventilation slots, and some duct tape to form a gasket, and it pulls the hot air right out. If you pick the 12V off the power supply regulator board at W3 (orange lead), it will even work properly when you run the radio off 12 volts.

[In order to blow hot air out, the fan must suck in cool air from somewhere. Users are advised to be on guard for dust being drawn into fan-equipped R-7000s. - Editor]

---

1. Brian Kantor, WB6CYT. University of California San Diego. ARPANET address: brian@ucsd.edu

TV INTERFACE FOR R7000

John Biro

I just got the video interface for the R7000, and to my surprise it is not an internal option. It bolts to the side of the radio (right side were the rubber feet use to mount). It is about 1 inch wide, and the same height and length as the R7000, and in a matching cabinet.

TV video is taken off the 10.7 MHz IF output jack, this presents a problem if you are using it for a Band Scope. It also "steals" the power from the IF output (the center pin of the IF out carries 12VDC so be careful not to short it out).

The interface provides RCA type jacks for both Video out and Audio out. The Video is standard levels and the Audio is low level output for input to a typical audio amp (it can not drive a speaker directly). I am not sure why the audio output is there as you can monitor the audio on the R7000, looking at the circuit they do have a sideband filter circuit so I would assume the audio is cleaner but I have not tried it and do not have any problem with the R7000 audio receiving WBFM from the TV stations.

Results: The TV-R7000 works OK, but I am just disappointed in the fact that it does not mount internally in the R7000. This could also help in its high price tag of $119. I had a Yaesu FRG9600 with video option (only about $30), and it worked about the same. The picture quality is good, and it is very stable. My antenna is vertically polarized, so I am working crossed polarized for TV stations but still get good results, strangely better on UHF then VHF freq. In fact, I get UHF on this set up better then my late model TV upstairs.

I think that I am most disappointed in the fact that the unit mounts on the side of the R7000. I don't have the extra inch of bench space, so I had to put rubber feet on the unit and lay it on its side on top of the R7000. It works fine and I do not see any difference with the case of each unit tied together or not.

I made a "T" adapter and ran both the BAND-SCOPE and TV on the IF output. I have not tried to add a third option to the IF output yet but it seems to be buffered from the main IF (wide band data 9600 baud).

- 6 -

The unit comes with schematic, installation info, and cables to hook it up to a video/audio monitor. Installation is 5 minutes or less if you know where to find

your screw driver the only tool required.

Now to look for some Amateur TV and for Hidden TV stations. There is more out there then featured in the TV Guide.

198 CHANNELS FOR YOUR
R7000 RECEIVER?

by Bob Parnass, AJ9S

The ICOM R7000 appears to use a uPD446C, 16K static RAM chip, for storing 99 memory channels. By looking at the pinout of this chip (IC8 on the Logic Unit) in my service manual, it appears that ICOM is only using 1/2 its memory capacity. Address lead A10 (pin 19) is soldered to a ground pad.

To double the number of memory channels in the R7000 to 198, it looks like one could "lift" pin 19 of IC8, and connect it to pin 24 (+Vcc) through a 10,000 ohm resistor. A SPST switch could be used to ground pin 19.

Another challenge would be finding a place on the R7000 to put the added "Memory Bank" switch. Perhaps one could use the Noise Blanker switch, and just leave the NB on at all times.

I don't have time to try this experiment, and would be interested in hearing results from any enterprising hobbyist willing to try this.

Long live tinkering!

[PS: Jack Albert, WA9FVP, reports that he tried the modification, and it works! Jack doesn't have the remote control option in his R7000, so he elected to use the front panel REMOTE switch as a bank switch. He installed a 48,000 ohm resistor between IC8 pin 19 and ground, and ran a wire from the REMOTE switch, through an 82,000 ohm resistor, to pin 19. When you switch between banks, you must also rotate the channel selector knob, forcing to the microprocessor to read from memory.]

- 8 -

DOUBLE THE MEMORY CHANNELS OF THE ICOM R7000 BY
REPLACING THE SPEECH SWITCH

by Jean-Louis Ecochard

This modification is based on information received both from Bob Parnass and from Gary on the ICOM Technical Support line.

Although simple, this modification is rather delicate to implement because it requires knowledge of unsoldering and soldering CMOS components. It also involves removing the speech switch. This will of course void any ICOM warranty and the result may be a very expensive paper weight. It is very important to note that some vendors of ICOM equipment offer a similar modification for ~$50.

WARNING

THIS OPERATION INVOLVES UNSOLDERING ONE LEAD OF THE CMOS MEMORY CHIP. CMOS DEVICES ARE EXTREMELY SENSITIVE TO STATIC ELECTRICITY. USE THE APPROPRIATE EQUIPMENT SUCH AS GROUND STRAP, GROUNDED SOLDERING IRON, ANTI STATIC MAT TO MAKE SURE YOU WILL NOT DAMAGE THE CHIP.

THE SILK SCREEN REPRODUCTION IN THE ICOM R7000 SERVICE MANUAL IS INCORRECT, REFER TO THE FOLLOWING DOCUMENT CONCERNING LOCATING THE POSITION OF THE SPEECH SWITCH. CONTACT ICOM FOR MORE DETAILS.

Equipment

anti static mat
ground wrist strap
tip grounded soldering iron
solder (thin)
set of screwdrivers
unsoldering pump
set small pliers wire cutters

Parts

- 9 -

photocopy of the exploded view of the R7000 from the ICOM R7000 service manual
remote switch ICOM part # SPUT 19167A
47 K Ohms resistor
small insulated wire

Time 2 to 4 hours

Preparation

Read this document completely. Select a smooth surface to work on such as an antistatic mat or a towel spread on a table. Put the R7000 in front of you with all the equipment you will need at reach. The receiver must be unplugged. For safety reasons and protection of your

equipment it is advisable that you leave the ICOM unplugged for a couple of hours to allow components to cool and capacitors to discharge. Take off the front panel and the bottom panel as described in the exploded views of the service manual. Disconnect and take off the logic board (remember the connector positions). Disconnect and take off the SW3 board it may require disconnecting other boards.

The memory module

Locate IC8 on the logic board. It is the chip with the battery on top of it. Locate pin 19. Use the reference in the service manual to find the correct pin labeled A10 (page 7-9).

Top view of IC8

```
1 24
o U o
o o
o o
o o
o o
o o <- 19
o o
o o
o o
o o
o o
o o
```

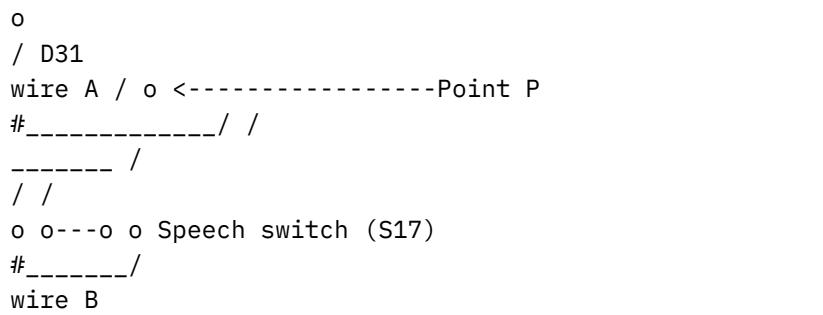
Now think on how difficult it will be to unsolder pin 19. If you think it is beyond your skills, get help.

- 10 -

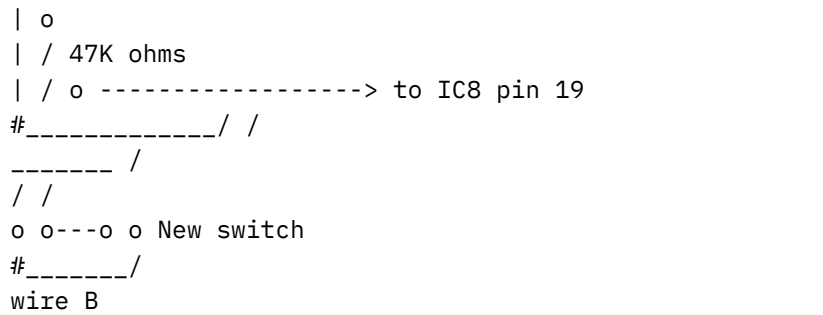
Unsolder pin 19 and use a pair of small pliers to pull it out of it hole. Make sure it does not touch the transistor nearby. solder a wire to pin 19. this wire must be long enough to reach the front panel later on. When this is done, verify that pin 19 is not in contact with anything (you may want to isolate it). You have done the most difficult part of the modification.

The switch board

Locate the speech switch on the SW3 board. Beware, the ICOM service manual has incorrect information (reversed) concerning the placement of switches on SW3. The speech switch is S17. Locate the pattern/trace below on the solder side of the SW3 board.



Unsolder the speech switch, the diode D31 and the wire A. Insulate the wire A so that it does not touch anything. Solder the 47K ohm resistor where the diode D31 was. Solder the new switch (SPUT 19167A) where the speech switch was, in the same position. Solder the wire that you have previously soldered to IC8 pin 19 to Point P. Solder a wire between where wire A was soldered and ground. A good place to connect to ground is around the screw next to S18 on the SW3 board.



Verify your work and reassemble the unit.

- 11 -

Results

In the "out" position, the switch gives you the original 99 memories, in position "in" you have 99 more memories. These memories will be most likely full of garbage, so the first step is to clear them using the clear switch. Clear all the 99 memories. This modification also double the program scan mode memories. For example, you can have two programmed scan depending on the position of the switch when you do a "SET".

- 12 -

MODIFY YOUR ICOM R7000 TO SCAN AND SEARCH FASTER

by Bob Parnass, AJ9S

This article describes how to increase the scan and search speeds of the ICOM R7000 receiver by 60% without

noticeable performance degradation.

Background

The front panel SCAN SPEED control on the R7000 receiver allows the user to adjust the speed of scanning and searching operations, as well as the rate at which the priority channel is sampled. Rotating the control counterclockwise decreases the speed, and rotating it clockwise increases the speed.

When the SCAN SPEED control on my R7000 (serial number 001400) was turned fully clockwise, the radio would scan a maximum of about 8 channels/second, or search about 8 increments/second. As the following table shows, the stock R7000 can scan about as fast as a Radio Shack PRO-30 or PRO-2003.

Table 1. Maximum Scan Rates of Selected Receivers

Scanner	Maximum Scan Rate (channels/second)
Kenwood TR-2600	1.2
Radio Shack PRO-30	8
Radio Shack PRO-2003	8
ICOM R7000 (stock)	8
ICOM R7000 (after modification)	13
Regency M400	13
Bearcat 20/20	15
Bearcat 300	15

R7000 Scan Circuits

The scan rate of the R7000 is determined, in part, by a simple clock outside the microprocessor. The front panel SCAN SPEED rheostat and resistor R18 (and other components in the LOGIC UNIT) control the speed of this clock. The clock output is connected to what appears to be an input port on the microprocessor. The upshot is that we can affect the scan rate without affecting

the other chores performed by the microprocessor.

The modification consists simply of soldering a 470,000 ohm resistor across the leads of resistor R18 on the LOGIC UNIT circuit board.

How was the value of 470,000 ohms chosen? Experimentation with different resistor values showed that for

values both above and below 470,000 ohms, the R7000 scan rate decreases. Not having the R7000 Service Manual, I assume this can be explained by the firmware within the microprocessor associated with the scan rate input port.2

Adding the 470,000 ohm resistor in parallel with R18, rather than just replacing R18, has a few advantages:

1. The modification is easily undone, returning the radio to stock condition.

2. The LOGIC UNIT board does not have to be removed, as would be the case if R18 was unsoldered from the foil side.

Making the Modification

Accessing this circuit board is not difficult, and involves the same steps used when installing the optional Remote Controller or Speech units.

Use a towel to cover your work area to avoid scratching the R7000 cabinet. Unplug the R7000 from the AC line, and turn the radio upside down. Remove the bottom cover by removing the 12 screws holding it in place.

Remove the 4 screws holding what ICOM terms the "partition panel". Pictures on pages 32 and 34 of the R7000 Instruction Manual show the partition panel. After removing this panel, the component side of the LOGIC UNIT circuit board is accessible.

---

2. Perhaps the firmware polls the scan rate input port infrequently. Another possibility is that the scanning pulses interrupt the processor, and the interrupt firmware is limited in its ability to process frequent interrupts.

Locate R18, a 270,000 ohm 1/8 watt resistor, near connector J5. You may wish to remove plug P5 from J5 temporarily if it gets in your way. Carefully solder a 470,000 ohm resistor in parallel with R18. I used a 1/4 watt resistor as it was the smallest on hand.

Reassemble the radio, connect it to AC power and antenna, and enjoy.

In the modified R7000, the scan and search rates are still adjustable using the SCAN SPEED control. With

the control turned fully clockwise (maximum speed), the modified R7000 scans at about 13 channels/second and won't miss weak signals.

A LOW COST PANADAPTOR
FOR THE R-7000

by Bob Parnass, AJ9S

A panadaptor, or spectrum display, is a device which portrays visually the signals in a part of the radio spectrum. Panadaptors allow radio listeners to "see" activity on a portion of band without requiring the listener to tune the receiver.

They are useful for detecting the presence of spread spectrum signals or "hidden" signals riding on a sub-carrier of a main channel. Panadaptors are invaluable for detecting spurious emissions from transmitters, and unwanted products caused when 2 or more signals mix.

Panadaptors most often employ a cathode ray tube (CRT) for the display, and must be connected to the intermediate frequency (IF) amplifier stage of a receiver, at a point before filtering takes place.

The ICOM R-7000 2-2000 MHz receiver rear panel has a phono jack for wide band 10.7 MHz IF output. A DC voltage is also present at this connector and is used to power an ICOM TV accessory.

I've seen mention of 3 panadaptors for the R7000:

1. John Biro's article on retuning a Yaesu YO901 Multiscope panadaptor for 10.7 MHz, restricted bandwidth use. Selectable bandwidths of 20, 100, or 200 KHz are available.

2. The Sherwood Communications SCA-7000 signal monitor, priced at $1600, and reviewed in May 1987 "Monitoring Times".3 Bandwidth adjustable from 1 KHz - 1 MHz.

3. The Spectra-Display, priced at $350, which requires use of an external scope.4 Bandwidth

---

3. Sherwood Communications, 1310 Industrial Highway, Southampton, PA 19866. tel (215)357-9056.

4. Spectra-Display is sold by GTI Electronics, RD 1 Box 272, Lehighton, PA 18235. tel (717)386-4032.

adjustable from 200 KHz - 10 MHz. Optional preamplifier required for 12 MHz wide sweep.

In the past month, several Kenwood SM-220 monitor scope/panadaptors have appeared at hamfests selling in the $200 to $250 range. The Kenwood SM-220 can display transmitted or received signals. To add spectral display capability to the SM-220, one must purchase the optional BS-5 or BS-8 module, which consist of a printed circuit board, a steel enclosure, interconnecting cables, and a new graticule. The panadaptor module mounts inside the SM-220 cabinet.

The BS-5 is used with the TS520 and TS530 transceivers, which have an IF of 3.395 MHz. The BS-8 is used with the TS820 and TS830 transceivers, which have an IF of 8.830 MHz. Since the IF of the ICOM R7000 is 10.7 MHz, one must alter the panadaptor circuitry to accept 10.7 MHz input.

If you have any choice in the matter, get the BS-8, as it requires fewer changes than the BS-5, and may even require no changes at all!

The panadaptor module circuit consists of several stages, but only two are directly related to the IF frequency:

1. A crystal oscillator is used as a marker generator.

2. A voltage tuned oscillator is swept across the IF of the receiver, and employs a varicap diode, an inductor and capacitors.

The marker generator is not vital for panadaptor operation. It merely provides a single "pip" that one may use to center the display on the CRT screen, and is similar in purpose to the crystal calibrator in older receivers.

The marker generator circuits in the BS-5 and BS-8 are identical except for one crystal. One need only replace the 3.395 MHz crystal (in the BS-5), or 8.830 MHz crystal (in the BS-8) with a 10.7 MHz crystal to adapt the SM-220 marker to 10.7 MHz IF. I did not alter this stage, although I would if I had a 10.7 MHz crystal handy.

The voltage tuned oscillator is the stage that deserves our attention. The changes required depend on whether

you have the BS-5 or BS-8 panadaptor module.

Changes for BS-5 Module

Change the following capacitors:

1. C231 from 1000 pf to 68 pf.

2. C232 from .01 uf to 1000 pf. (You can use the capacitor which used to be C231.)

3. C234 from 100 pf to 22 pf.

4. C236 from 47 pf to 22 pf.

5. C237 from 680 pf to 100 pf. (You can use the capacitor which used to be C234.)

Solder a 10 microhenry inductor in parallel with L204, a 20 microhenry inductor.

Changes for BS-8 Module

I haven't tried the BS-8 module, but encourage you to try using it as is, without modification unless necessary.

These steps are needed only if you cannot find settings of the side mounted aligment controls that get the display to behave as specified in the owner's manual:

1. Remove C233, the 33 pf disc capacitor, from the printed circuit board.

2. Replace coil L204, the 4.7 microhenry inductor, with a 6 or 7 microhenry inductor.

Alignment

Follow the alignment procedure in the SM-220 owner's manual to adjust the panadaptor. This consists of adjusting 2 potentiometers and 1 trimmer capacitor through holes thoughtfully provided in the side of the cabinet.

The alignment instructions rely on the use of the internal Marker Generator to generate a signal at the center of the passband. If you haven't converted the

Marker Generator circuit, you can tune your receiver to a frequency with a signal present at a known frequency (like 162.550 MHz - the National Weather Service), and use that as a frequency standard.

Most of the time spent in aligment will be in alternate adjustments between the trimmer capacitor and the wide band sweep potentiometer, which interact with each other.

Wider Bandwidth

The SCAN WIDTH switch on the stock SM-220 can be set to display a 40 KHz or a 200 KHz wide picture. I adjusted my modified SM-220 to display a 100 KHz or a 500 KHz wide picture. By adjusting the controls on the side of the SM-220, wider bandwidths are possible, but wider bandwidths make it more difficult to resolve individual signals close to each other in frequency. As the bandwidth gets wider, the horizontal sweep loses linearity, causing the graticule calibration lines to be inaccurate.

Connection to R-7000

As mentioned earlier, a DC voltage is present at the R-7000 IF output connector and is used to power an ICOM TV accessory. A direct connection between the R-7000 IF output connector and SM-220 would damage at least one of these units.

To block the DC voltage, a 0.1 microfarad capacitor was soldered inside the R-7000, between the IF output jack and the adjacent jack labeled "spare". Connection between the R-7000 and SM-220 is then made using a short length of RG-58/U coaxial cable, with one end plugged into the R-7000 "spare" jack, and the other end plugged into the rear of the SM-220.

This leaves the original IF output jack undisturbed so it can be used with the TV adaptor accessory.

Vertical Sensitivity

When I connected my modified SM-220 to my R7000, the SM-220 would display only the strongest of signals. To improve the display sensitivity, I inserted a 20 dB gain RF amplifier between the R7000 and SM-220. The

amplifier was a spare Ameco PLF2 FET receiver preamp, adjusted for 10.7 MHz, but other amplifiers can be used, provided they have at least a 500 KHz bandwidth, and sufficient gain, at 10.7 MHz.

False Readings - Images

The SM-220 circuit is like a superheterodyne receiver. The panadaptor itself has a 455 KHz IF, and like other

superheterodyne receivers with a low IF frequency, is prone to images.

An image is manifested as a false pip, which moves across the screen as the receiver is tuned, and is 910 KHz (twice the IF) away from the actual signal.

The images discussed here are in the SM-220, not in the receiver. Images are bothersome on the strongest signals, like those 300 watt paging transmitters that saturate the county with RF, belching out out strange digital noises or voices (now illegal to monitor).

Use With Other Receivers

The modified SM-220 can be used with other receivers having a 10.7 MHz IF. In other receivers, one would need to find the proper point in the IF stage (before filtering takes place), install a connector, then wire a DC blocking capacitor between the IF stage and connector.

WIDER FM FILTER IN THR R-7000

by Barre Ludvigsen

I am trying to replace one of the 10.7mhz IF 150khz FM filters of my ICR-7000 with an XF-107E (40khz) wide crystal filter from Spectrum (the type designator is from memory) for better APT reception.

Right now I am using the 150khz bandwidth which works, but gives me some interference. I have tried to insert the 40khz filter i // with the 150 using a switching circuit similar to those used in the narrow FM filtering schemes, but the new filter seems narrower than 40khz and gives excessive noise.

The reason I want to use a switchable circuit is to retain the 150khz bandwidth for broadcast FM and audio through the radio when using the TVR-7000 unit. I suppose I could forsake broadcast and take the TV audio out of the TV unit, but switching would be nice.

Memory Scan Using the R-7000 Remote Control

by Johnathan Vail, N1DXG
Tegra-Varityper, Inc., Billerica, MA

Here are the details of a mod I sent to MT a few years ago:

This will change the function of the MS key on the remote control to select SELECTED MEMORY SCAN instead of MODE scan. Why they didn't provide this as a function in the first place seems rather odd.

On the remote control option board inside the R7000, remove the cathode of D40 from the board and bend the diode up slightly. Attach a small wire, like #30 wire-wrap or something, to the lifted cathode and tack solder it to the cathode of D32.

You could do this with cuts on the board but the tack solder method allows the mod to be backed out easily if needed.

An alternative method is to run the wire from D40 through the hole where it used to be, and solder to the gray wire (pin 8) of P1.

I figured this out with a scope and the schematic. The switches are all polled by the CPU through a diode matrix. Lots of combinations are possible but I didn't fool around too much.

I already have the software mod, thank you! I'm just the kinda guy who can't resist doing surgery on things. Besides, the cellular handset frequencies isn't in the software mod and you can't program any cell stuff into the LIMIT function. I thought I saw a hardware mod once upon a time but I didn't save it because I didn't have the radio at the time.

Thanks,
David

This one may become a classic. Chuck was recently sentenced to 10 years in
prison for cultivating marijuana. He may not be doing much publishing
in the meantime about current monitoring.

The Tropez model has this too and I think it stinks. It lowers the battery life considerably if you leave the handset off the base. The ability to turn the "polling" OFF would be great. Since the useable range of the phone is several hundred feet and I only use it in my apartment, when do I need it to tell me I'm out of range????????

At the local McD's the high school kids manning the order windows like to discuss their private lives between orders; who they're dating, what they "do" on the dates, rating the boys, etc. etc. Not that I care, but I was curious what freq the local store used. Happens to be beside a Walmart that I was checking freq's at (both use the standard business band freq's') Sorta like cordless phones -- listen once or twice to say you can do it, then move on.

- Sh> From now on I plan to only read and post to REC.RADIO.SCANNER. There
- Sh> are twice as many postings on it in one day than on ALT.RADIO.SCANNER-
- Sh> I don't see the need to see the same half a dozen messages twice when
- Sh> people cross-post (I've been guilty of it myself) knowing most of us
-
- Let's all agree that REC.RADIO.SCANNER is the place for technical and
- factual information exchange - frequencies, antennas, how different radio
- technologies work, etc.

The charter for rec.radio.scanner governs what topics are valid for discussion, not an agreement by the users UNLESS they want to attempt to revise the charter.

- And let's all agree that ALT.RADIO.SCANNER is the
- forum for broader discussion or non-technical issues - laws, freedoms,
- ethics, opinions about commercial practices, etc. Both types of discussions
- are quite valid but each have a time and a place and probably ought to
- function separately.

You cannot assign specific topics of conversation to an alt.* group and expect it to work. alt.propogation is poor enough that there are plenty of people who may want to discuss what you want to limit to the alt group but they have no access to it.

- I don't know much about how Usenet is governed. I gather there is some
- official process far-away to structure newsgroups, but I've always
- preferred grassrooots consensus to official decisions anyways.

You have a bit to learn about Usenet then. There are structures and processes. And for some additional information for you, alt is not Usenet. It has its own rules (damn few) and conventions (ditto) and suffers propogation problems because of its nature.

Cross-posted to: rec.radio.scanner,alt.radio.scanner

Does anyone have any experience or comments regarding the Grove No-Tenna?

Are they doing anything special with coax and/or wire and some clips that a person couldn't pattern and put together themselves for less money? What are they doing: connecting the shield of the coax to one point on the vechile frame and connecting the inside conductor to another point?

If a scanner picks up motor noise and/or interferference from on-board computers, etc. with a portable unit *not* connected in any way to the vehicle (not powered from the lighter, etc.), will that interference be worse with the No-Tenna? Certain VHF fequencies get locked up when the motor and/or computer(s) are running or powered up.

Would you expect the No-Tenna to work better or worse than a duckie antenna suction-cupped to the inside of the glass with a few feet of coax?

Thanks for your comments.

I would like to know if there is a test mode for the pro-39 ???
If anyone can tell me this please e-mail me at lostisle@crl.com

Please send brief description of test mode options or functions
as well.

Thanx for your help

Vic

Years ago I did the same thing using a "Y" shaped adapter so that the
radio and the scanner could both be hooked up to the car antenna. Worked
fine.

berling@alleg.edu (Gordon Berlin) writes:
:
: Forgive me for opening the can of worms...I am a Political Science major with emphasis on law, and offer the following: California's law is not designed to deal with communications, but with *privacy*, which is not solely the domain of the federal government.

States are not allowed to override federal law and precedents. This is the case when it comes to cordless phones. The federal courts (I believe all the way to the Supreme Court) have ruled that cordless users "cannot have an expectation of privacy". That was a reasonable ruling, as the person using the phone is broadcasting a signal - even if the signal is intended to be received by only one person. The law that is stupid is the federal law making it illegal to listen to cellular broadcasts - as if there were a difference between cellular and cordless phones (except for the megadollars that the cellular lobby has to buy legislators).

A somewhat reasonable law would simply make it illegal to decrypt broadcast signals. Here, there is a strong attempt to keep the communication private, and it could be argued that these people have an expectation that their communication would be private.

Personally, I think the Communications Act of 1934 (?) is fully sufficient. That law makes it illegal to divulge what you hear to others, or to profit by what you hear - with exceptions noted for some types of broadcasts.

Please forgive me if this issue has been discussed before, I was just wondering if it would be possible to get a good sound output from a scanner thru your cars radio speakers. I have a BC55XLT that I listen to going to and from work and the idea popped into my head and I was wondering if it would be feasible. Thanks in Advance for any helpful comments.

Gosh, and FM radio stations broadcast on 88.1 MHz, 88.3 MHz, ..., 107.9 MHz,
but I only hear stations on some of these -- less than half, in fact. I
wonder why that could be?

(Get a clue, Glen. Not all of the WX freqs are in use in all areas. In fact,
in general, it's one per area.)

1514. Negril, Jamaica Freqs

Newsgroup: rec.radio.scanner
Date: 1994-09-02 11:20:23 UTC
From: doogie@dcsborg.cls.com
Message-ID: <o1V1Rc1w165w@dcsborg.cls.com>
Source record: 269353

On a recent trip to an infamous resort on Bloody Bay in Negril, Jamaica, I brought my Pro-43 along and did a little scanning while sunning on the beach. We were only there a few days, so the list isn't quite complete, and the freqs may not be 100% identified correct, but it's a start! :-)

154.1250 - Hedonism II housekeeping/staff
156.8000 - Boat/water recreation dispatch - Heard various boats being sent to Grand Lido and Swept Away
157.1000 - Grand Lido communicating with their boats
154.6000 - (?) Hotel Security - Hedonism II? Grand Lido? Sandals?
151.6250 - Unable to identify - Maintenance staff?
139.8300 - Phone Patch
137.3600 - Phone Patch
148.8000 - Pager with voice
138.5700 - Phone Patch
139.2000 - Phone Patch

These were the busiest freqs I found. There wasn't much radio activity other than these, although I did find the same cellular freq ranges as the US were in use there. I even checked to see if my cell phone would work in roam mode and found that it did. Didn't make any calls with it though. If anyone can add to this list or identify better any of the above freqs, please do! Enjoy!

Hi Jimmy,
I've found that those portable CD player to cassette adapters work
great for using the cars speakers for my scanner. You just pop the
adapter into the cassette deck, plug the mini-jack on the wire
coming out of the adapter into your scanner, and listen away! One
thing, you'll need to get a mini-plug mono to stereo converter
so you have the sound coming out of both channels. You can get one
from Rat Shack for a dollar or two. Hope this helps!

>
> Paulo,N3MGA

The MX7000 was a cross between the MX5000/AR2001 & the MX8000/
AR2002. It had the coverage of the later models but rather than
the buttons & Signal meter it had previous "case" with touch
keypad of the '5000 and no S meter.

The only mod I can remember is you could speed up the scan rate by
changing the value of a capicitor on the CPU board, this had the
detromental effect of causing problems with the delay for some
reason and if you put a valued capacitor that caused the scan rate
to increase too far the PLL would not lock up very well. (A
problem that occured with the AR2515 hybred to some dgeree).

Fromn memory some of the early AR2002's had the RF boards of the
AR2001 with the addition of a 800-1300MHz board, later models had just
one board - I am not sure what the MX7000 had.

1518. Re: AOR AR-8000 Receiver

Newsgroup: rec.radio.scanner
Date: 1994-09-02 11:57:55 UTC
From: chill@wv.mentorg.com
Message-ID: <347403$s9r@newsgw.mentorg.com>
Source record: 269550
Cross-posted to: rec.radio.shortwave,rec.radio.scanner

I went to my local dealer (Lowe Electronics, Newbury, UK)
yesterday, to buy an AR-8000. However, I was advised by
them to hold off for a while. They (as a small chain of
outlets) had been experiencing problems with the first
batch of receivers the received from AOR. These
faults seem to manifest themselves as cpu lockups - the
display light comes on and the thing locks up, removing
the batteries and then reseting seems to cure it (without
memory loss) and also spontaneous memory corruptions.

Have any of the AR-8000 owners had problems?

Scanner for sale:

Uniden Bearcat BC-200XLT 200 channel programmable scanner.
- 200 channels
- 12 band coverage
- automatic search
- priority channel
- selective scan delay
- display light
- automatic lockout
- track tuning
- direct channel access
- rechargable battery pack
- AC adapter for the unit

Comes with manual and original box.

I've only had this unit about 6 months.

$175 includes shipping.

I have a 7100 scanner for sale. Barely used, perfect condition.
It includes all accessories in the original box, plus a Radio Shack
loaded antenna.

This scanner goes from 530KHz to 1.650GHz completely continuous.
1000 memories. Multiple modes (FM, AM, etc, LSB, etc), multiple
frequency steps, etc.

This cost me $579 + $35 (customs) + $10 (antenna). It is also no
longer importable into the US.

Selling for $650 (including shipping via normal UPS).

Sony 2010 - 3

I found it VERY easy to plug in and start listening. The supplied instructions are adequate for what they do, but are not really enough to really start enjoying the radio. The whip antenna works great at home, but just doesn't cut it at work (way too much metal/interference). Even the supplied wire antenna does not seem to help at work (I have not yet tried it at home (no real need).

****
Realistic DX-342 - 1

I've owned this little radio for about a year now and am really pretty happy with it.

Advantages: Size - Measuring approximately 4 3/4 x 2 5/8 x 1, you can take this little mini anywhere! Even slip it into your shirt pocket!
SW bands - Covers 9 SW bands: 49m, 41m, 31m, 25m, 21m, 19m and 16m.
MW, FM, FM Stereo (thru headphones)
Travel Power lock
Push button control
Runs on two AA batteries or AC adapter
Travel pouch
Carrying strap

Disadvantages: It's an analog unit, guys and gals, no digital display.
No back stand
Antenna does not rotate up

I've had a lot of fun with this little receiver. The SW sensitivity is quite good for my area of the country, Cleveland, Ohio. The speaker has a nice sound and improves thru the earphones. FM stereo thru headphones is great! MW DXing is surprisingly good! I can grab signals from Boston, Chicago, New York and Cincinnati much better than on my Magnavox AE 3625 Digital!

Summary: A nice little travel radio that's fun to fiddle with or take for travel when you're in a pinch. Radio Shack has discontinued this model so you might be able to find it on sale for around $50.00. I love the size! Ideal for travel! I'm

beginning to think that anything larger is too
cumbersome. I do miss the Digital Display and all the
features that go with it: Freq. display, Alarms,
world time display, etc. If I were buying today, though,
I'd consider what else is out there for just a bit more
money. For example, the new Sangean 606 is only
slightly larger and has all the digital features mentioned above that I miss. I
've seen it priced for as little as
$179.95!

****
Realistic DX-350 - 1

I bought this radio when I first started out in shortwave listening
because it was the cheapest thing at Radio Shack. I think I paid $60
for, but I'm pretty sure the price has gone down since then.

Nowadays I mostly use it as my travel radio. Sesnitivity is okay for the
price, but not too great. When I'm at home (western US) I can pick up
the major international broadcasters, but no too much else. On my trips
back East, I've found sensitivity picks up some, but it's still only
fair.

Performance on the AM and FM bands is average, but longwave seems to be
nearly useless. I've never heard any nav beacons on this one, even
though there are several near my house.

Radio Shack sells a reel antenna for about $8, and I picked one of these
up when I bought my radio. It helps reception a little, but not very
much. A much better solution is to wrap a stripped end of a wire around
the the whip antenna, and attach the other end to a metal windowframe.
I've tried connecting my longwire to it, but that just overloads the
receiver (not surprising).

One major problem that I've noted is that the dial markings on some
shortwave bands seem to be off by up to 10 kHz. If you know about it,
it's not much of a problem to work around, but initially it could be
quite confusing.

Overall, this receiver is average for its price. There's no real
surprises, either good or bad. If you really want an inexpensive radio,
go for this one. Otherwise, I would advise saving your money and going
for an inexpensive digital radio.

****
Realistic DX-375 - 1

It costs $99.99 though I got it for $89 since I had a coupon for a
rebate. For the price I think I got a good deal. It has digital tuning
and direct input of frequencies which allows tuning to be a pretty
simple job and not a time consuming act of patience. It uses two C type
batteries... I use rechargable ones and they last a pretty long time..

It is not small enough to carry in your shirt pocket but it could fit in the front or side pocket of an average sized backpack. It is just great when you are walking back home from school/work ... it can be easily carried in one hand as you catch up on the news from BBC/Deutschewelle/Radio Australia/etc.... as you walk home..
I get decent reception of all the `big stations' even indoors and have, on occasion also been able to tune to Radio UAE....

The sleep function is perfect for someone like me who likes to fall asleep with music... the FM sound is pretty good in stereo (headphones)... The AM reception is also fairly good but it has a very high tendency to catch those Bible bashing stations...probably a reflection of the region where I live...

The strap is a little shoddy and I have a feeling I may have to `fix it' soon... I expect it to pop out any moment....
Despite that, I like it...

****
Realistic DX-380 -2

I've owned a DX-380 for about 9 months now and....
It's a GREAT RADIO! However, I should qualify this. I bought it on sale from Radio Shack for the bargain price of $129.95! It regularly retails for $179.95. At $130.00, this radio is a real steal!

About the size of a large paperback book, the 380 is feature packed!

*DUAL CLOCKS
*ALARM WITH RADIO/BUZZER
*60 MINUTE SLEEP TIMER
*DUAL BANDWIDTHS
*DIRECT FREQ. ENTRY TUNING
*TUNING KNOB
*SLEW TUNING
*TUNES IN 1 OR 5 KHZ STEPS
*CLOCK DISPLAYED SEPARATELY
*BACKSTAND
*STEREO THRU HEADPHONES
*CONTINUOUS SW COVERAGE...NO GAPS!
*AUTO SCAN UP OR DOWN
*ANTENNA ROTATES AND SWIVELS
*CARRYING CASE

The sensitivity of this radio is GREAT! With a reel antenna, it's even better! I read another review that said reception was lousy....I think that individual should check his particular receiver as he might have the rare defective unit. MW reception is also outstanding and with a Slect-A-Tenna is greatly improved! Herein Cleveland, I pick up Chicago, Cincinnati, and Pittsburgh during the day WITHOUT the select-a-tenna! With the S-A-T reception gets an added boost!

(these are all 50,000 watt stations)

I have found it to be about the perfect travel size. I would like something smaller, like the 606. This size, however is fine. I've carried hardbound books on jets that are larger. The many features makes up for it's slightly larger size over a mini. It does not have SSB, but I really don't miss it.

All in all, A great radio priced at $130.00! I would not have bought it for the price of $179.95. There are other radios in that price range that ive ya more bang for the buck. At $130.00, it's a great deal! If you can get it at that price, snap it up!

I am by no means an expert, but I have a DX-380 and can give some of my experiences. First of all, I would pay the extra to get the 390 to get the single side band capability. I miss it. I miss it. Also, the sensitivity for foreign broadcasts (I'm in DC) without an external antenna is poor. You get the BBC and some German broadcast relays from Canada transmitters, some south american stuff, and that's it. BUT with a 50 m Cu wire out my 2nd story window attached to the antenna with an alligator clip, I regularly get Abu Dhabi and Australia at night.

****
Realistic DX-390 - 2

Great mid-sized digital portable. Good sensitivity and selectivity. Digital display shows time, frequency, signal strength, and memory location. Covers LW (in 9 kHz steps), MW (in 9 or 10 kHz steps) and SW continuously from 150 kHz to 30000 kHz. FM reception (88-108 MHz) with stereo through headphone jack. BFO control for SSB reception. Built-in timer/clock, 9 programmable memory locations per band, except 18 on SW. Good audio output. RF Gain and AM bandwidth controls. Keypad frequency entry. External antenna, AC-adapter inputs.

A great radio for the beginner or as an upgrade from a smaller and/or analog unit.

Purchased from Radio Shack for $219 in January, 1992.

I have a new Realistic DX-390 (alias Sangean 813??). Seems to be a great value for the price $169 US. I haven't yet heard from someone who can recommend a radio for the same price that is better, and can back it up with facts.

****
Grundig Satellit 700 - 3

Truly a world-class portable, digital receiver. Excellent sensitivity and selectivity. Digital display with two separate clock/timers, signal strength meter, band selection, frequency readout, and user-definable eight-character "name" for each

memorized station. Has RDS circuitry on FM to decode the newly-phased-in system for identifying stations by call letters, format, etc. 512 memory positions, upgradable to 2048. Tunes in .1 kHz increments. Selectable wide/narrow bandwidth for AM mode reception. Tunes MW in 9 or 10 kHz steps. Keypad frequency entry. Receives USB and LSB. Synchonous detector helps pick difficult-to-receive stations out of the crowd. Selectable automatic/manual gain control. Covers LW (150-353 kHz), MW (528-1611 kHz), SW (1612-30000 kHz), and FM (87.5-108 MHz). Excellent audio output, with separate treble and bass controls. Stereo through headphones or external speakers. Line-level out (left and right), external antenna, and 12 VDC-in jacks. Local/DX switch. Built extremely rugged. Multi-national power supply included.

An outstanding performer, and worth the price to a serious SWL or DX'er who requires portability.

Purchased from Universal Radio for $479 in April, 1993.

The Following is a comparison of the SONY ICF-SW77 and the GRUNDIG SATELLIT 700:

Both of the receivers you are looking at are pretty solid. The Sony is slightly smaller and has a somewhat more "finished" feel about it. The Grundig is SOLID with a much better sound. Neither is as good a SW signal receiver as the previous Sony, the '2010 (2001). However, they both have very advanced features; multiple (and in the Grundigs case, expandable) memories with alphanumeric tags so that you have a name as well as a frequency, all sorts of memory grouping and scanning etc. The Grundig has good RDS ident. on it's FM band, but I have a feeling that this isn't used much, if at all, in the US. If you intend to buy second-hand, be very wary of the SW77 - the early version was pretty flakey. The later version is better but still not as good as the '2010.
I think that the choice comes down to "feel". They are both quite complex to use, but both work as advertised. Try 'em both as they have quite distinct operational methods. If sheer performance on SW is the main point for you, compare them with the Sony ICF2010. You'll buy it and save some loot !
For what it's worth, I tried them both and settled on the Grundig. I have my Satellit 700 in daily use and it's performed without a hitch.

My reasons for the choice were:

1. Performance. The Grudig was much better than the early SW77.
2. Sound. I happen to prefer the slightly bassy Grundig sound to the somewhat sharper Sony.
3. Power. The Grundig takes D cells and can self-charge Nicads in the set, which is how I have it set up. (The SW77 used C cells)

They both run down batteries fast. The Sony worse than the Grundig due to it's smaller cells.
4. RDS. I love it and the SW77 doesn't have it.
5. Feel. I like the, I don't know, Germanic solidity and sheer heft of the Satellit. A Satellit with a full load of 4AH Nicads can tip the scales at twice the weight of a SW77. Of course, if drop one on your foot the Sony would be the better bet ! I only use the Grudig about the house. I have a '2010 for the road.

I hope this splurge hasn't clouded the issue for you.

Editor's Note:
I have one of these radios and love it! I sent the following message to someone just after I bought it.

I just recently forked out $500 and bought a Grundig Satalit 700. The sound from the radio is truely impressive! I have always wondered why broadcasters put music on shortwave, because it alway sounded like garbage. However with the 700 I can listen and enjoy the music. The 700 has Bass and Treble controls, which improve the sound quality but the Automatic Gain Control most likely does the most toward improving the sound (I'm not an expert, so this is just a guess!). Anyway my Wife regularly listens to music coming from a 60m band radio station in Guatemala, and can enjoy the sound. However there are some bad points. It is programable, but I have not worked out how to do it yet. Well I tried once and gave up. This is not too bad though, because BBC, Deutche Welle, and about 10 others are stored in a ROM table. And these frequences actual work (i.e. they are the frequencies for North America and NOT Germany).
Also I connected a long wire antenna and found my local AM station on shortwave. I guess the front-end is not good enough to sort the signals out when coming from a large antenna. But don't worry about this either.
If you only want to listen to the biggies like BBC, Deutche Welle, you won't need an external antenna. I am planning to put a Pre-selector between The Radio and the Antenna, and I think this will cure the problem of AM stations on shortwave and cut out some interference. Finally I recommend this radio to you. I'm sure you will have hours if enjoyment from it.

****
Grundig Satellit 500 - 2

Formerly Grundig's flagship portable SW receiver, this is still an excellent piece of equipment. Excellent sensitivity and selectivity. Digital display with two separate clocks (only one displayed at a time), signal strength meter, frequency readout, and four-character user-definable "name" for each memorized station. 42 memory positions. Tunes to .1 kHz

increments. Selectable wide/narrow bandwidth for AM mode reception. Tunes MW in 9 or 10 kHz steps. Keypad frequency entry. In addition to AM, has three receiving "modes" for LW, MW, and SW: USB, LSB, and "Sync," which should more accurately be described as "fine tuning," as this implementation of synchronous detection operates differently from the Satellit 700 or Sony 2010. Selectable automatic/manual gain control. Covers LW (150-353 kHz), MW (528-1611 kHz), SW (1612-30000 kHz), and FM (87.5-108 MHz).
Excellent audio output, with separate treble and bass controls. Stereo through headphones. Line-level out (mono), external antenna, and 12 VDC-in jacks. Local/DX switch.
Built extremely rugged. Power supply included.

An all-around great performer. Now that it's discontinued, many outlets are selling this unit at close-out prices, making this radio an excellent value for the money.

Purchased from Universal Radio for $379 in December, 1992.

I have a Grundig Satellit 500 and am basically satisfied with it. I miss the 512 memories of 700 and 'SSB clarify' control sometimes.

Yes, its 'sync' is exactly fine tuning in 100 Hz steps. However, it is rather simple to make it work similarly to '700 and '2010, because the detector chip is the same in all three. Only a switch with two pairs of contacts is needed. Another design fault, the excessive distortion in SSB mode, can be partly cured by adding two resistors. For serious DX-ers it may be important that the internal ferrite rod cannot be disabled on MW and LW in both 500 and 700, so the in-house noise may become a problem on these bands.

****
Lowe HF-150 - 1

The Lowe HF-150 (sold by Universal and EEB) is a nice compromise. Similar number of cubic inches as the Sony (different shape), but offering some features of the R8. Also the Lowe is made with a mostly solid alumnum case, which is better than the Sony or the Drake. The Lowe has dual antenna inputs (wire or SO-239), record out, audio out, 12vDC in. It can run off any 12V DC battery.
I use 7 aH gelcells which I recharge. The Lowe also takes 8 internal AA nicads *OR* disposable batteries. It will recharge the nicads with a builtin recharger if you plug it into an external power supply. It's a nice semi-portable radio. It has a few ideosyncracies, but you might want to look at it.

****
Lowe HF-225 - 2

I've had an HF-225 for a few years now, and I'm pretty happy with it. I use it mainly for broadcast listening. It's connected to 25m of random wire via a 5m coax run inside the house.

I tried using an ATU to improve the matching between the aerial and the coax, and on some frequencies it gave a (small) improvement in signal strength, but it was such a pain to keep retuning that I gave up using it.

I recently bought a "magnetic longwire balun", and this seems to offer the best of both worlds - improved matching between the wire and the coax, but no retuning necessary. It's rather expensive, though, and it may be that I'd have been just as well off with a home brew transformer on a ferrite ring...

The other potential advantage of an ATU, filtering out of strong signals well away from where you're listening, seems to be completely irrelevant on the HF-225. I've never yet found a case where switching in the attenuator did anything beneficial. The receiver's front end seems to be excellent in this respect.

I've got the sychronous detector option, and I wouldn't be without it. It quite often makes a heavily fading signal quite pleasant to listen to. Pity it doesn't have a selectable sideband option, though - I quite often find myself tuning an AM signal in the LSB or USB modes to try to get rid of an adjacent interfering signal.

Would I buy it again? Yes, unless I decided that I really wanted a receiver which offered a computer interface.

****
Sony SW-1 - 2

I bought an SW1E over a year ago, for listening to broadcast SW and FM at home and while travelling. I like this very small radio a lot. It is maybe expensive for a portable, but the build quality is very good, - everything looks and feels right.
Battery life is good, and the set DOES work with NiCads (2*AA) contrary to the instructions. Reception of broadcast SW is good, either with the whip or clothes-line antenna. I've never noticed any big problems from adjacent channels either. As a bonus, FM stereo reception is good through headphones. Audio quality from the in-built speaker is fair, but you'll want to use phones for noisy environments. The only bug with this radio is the memory capacity - only 10 mems is really not enough to cover ALL of AM and FM.
Summary - if you want a very small portable, and appreciate high quality (and can afford it), I would recommend the SW1E. Note the E, which denotes the SW1 kit without the active antenna and brief case - these add a lot to the price, and I don't rate the antenna too highly either.

****
Sony SW-15 - 1

I bought one of these puppies on impulse the other day (at my age you should give in to the occasional impulse, just so they keep coming). Cost $85; you could probably do better by shopping the discounters.

Specs:

Dual Conversion Receiver, 6 1/2 x 4 x 1 1/2 inches, 3 AA or 4.5v DC.

Nine Bands:

FM: 76-108 Mhz, 10.7 Mhz IF.

SW: 5.775 -6.425; 6.875-7.525; 9.375-10.025; 11.6.5-12.265; 15.00-15.65 17.50-18.15; 21.325-21.975. 1st IF 10.7 Mhz; 2nd IF 455 Khz.

MW: 530 - 1710 Khz; 455 Khz IF.

Analog Tuning dial, volume control, music/news tone switch, 7 position SW band selector. FM/MW/SW select buttons double as "on" switches. "Off" button. "Hold" button to disable "on" (prevents accidental turnons) Slide rule, multicolumn frequency display. Hand strap, foldout stand to hold at angle on table, soft carrying case. Basic shortwave guide. Telescoping antenna. FM/MW/SW "on" and tuning LEDs. Mono earphone jack.

Subjective Review:

I'm pretty impressed. Sensitivity is up there with the Pomtrex [:-)] without the "splatter" of strong stations. Analog tuning dial requires a delicate touch but for me that's part of the fun. Drift seems nonexistent; you get a station and it keeps it without a lot of vernier twiddling. MW performance was surprisingly good, as was FM. I'd recommend it as a starter radio.

****
Sony ICF-5100 - 1

I bought this radio in Kuala Lumpur in 1988, and I'm not sure if it goes by the same model number in other parts of the world. It is a shirt pocket analog tuned radio with coverage from 6MZ to about 21MZ in seven bands. The radio is very rugged and has served me well despite of the physical abuse it has gone through. Because of its small size the speaker is only small and the sound from it it a little tinny, but I used it mainly to receive news in countries without English language news services and in remote areas while camping etc. I recommend this radio to anyone, who considers size the most important factor. Cost was about US$70.

****
Sony ICF-7601 - 2

In some respects this is my favorite radio. No bells no whistles no FM stereo -- just a good solid (feels like a small brick)

analogue unit. It covers AM, FM and has 10 SW bands that cover most of the "out of band" frequencies. Band switching on SW is done by a slide on the front of the radio while buttons are used to switch from AM to FM to SW. The dial is accurate to 5 kHz so is very easy to locate a station. I believe that it was simply the best low cost analogue rig out there. It's still around and can be had for well under $100.00. Grab it!!

I have a 7601 also. Most of its weight is from the batteries and the speaker, giving it better tone and volume than smaller, lighter sets.

As with other cheap analog sets, it wasn't very hot out of the box.

If you "super tweek" the 7601, it's pretty good on AM, but no match for a 2010 or Superradio III. Most of the shortwave bands peaked up well, but I never could get 19 meters working right. As with most analog portables, the whip is part of the RF tuned circuit, so one must be careful to duplicate the exact listening conditions when tweeking the radio. Even the presence of headphones will shift the antenna tuning.

Unfortunately the 7601 picks up FM stations at various places on the shortwave bands. If you're far enough away from FM and TV stations you might have room for an R-390.

When going on trips I usually take my SW-1 because of the convenience of the presets and the reception flexibility provided by the active antenna that comes with it.

****
Sony ICF-SW33 - 1

I've owned this radio (SW33) for about 9 months and use it as my "carrying around the house rig." It was purchased to replace a Sony 7601 that now resides on my desk at college (things electronic can grow legs on a college campus). By far the best features of this unit are its convenient size and excellent performance on all bands, AM, SW and FM stereo. Don't get me wrong -- this is not a DX machine on SW but for listening to the major broadcasters, it's excellent.

The single filter selection seems just about right and tuning on SW is in 1 kHz intervals. This at least gives you a "fighting chance" to move away from interference. That's a major improvement over the 5 kHz that many radios in this price range allow. In addition, the dual conversion design on SW keeps image interference at bay - a major plus for a small portable.

The radio does not have a keypad so entering frequencies is a bit clumsy. However, by entering the middle frequency of each of the major SW bands in the 7 memories (5 memories plus 2 timer

memories) and slewing up or down from those positions you can get around reasonability fast. The SW bands are changed by a combination of 2 keystrokes.

The sleep control (shuts the radio off after 1 hour) can let you be lulled to sleep and the timer alarm can make sure that you get to work on time (radio shuts down after 2 hours if it is turned on by the timer). Setting the radio alarm is very easy - once you have set the clock, but that frankly, is a pain. The clock function, which works very well (combination world/home time), takes at least 7 distinct steps to set it. Fortunately the clock is fairly accurate (looses about 0.2 sec/day) so you don't have to reset it very often. The lighted dial (stays on for 20 sec at the touch of a button) is a nice touch.

Battery life is excellent contrary to the 1994 Passport to World Band Radio (see below). The radio has a battery "gauge" that is activated at the touch of a button radio and shows in the display as a battery icon with 3, 2, 1 or 0 dots inside of the battery outline. It disappears after about 5 seconds. As soon as the number of dots reaches 0, the radio shuts off immediately. I ran a a series of tests with Radio Shacks Super Alkaline batteries and got the following results: 3 dots showed for 37 hours, then 2 dots showed for an additional 11 hours, and finally 1 dot showed for 3.0 hours for a total of 51 hours. (Radio ran 1.5 to 2.5 hours/day with the volume control set at 1/2 volume most of the time). At $2.89 (plus 5% for tax) for a package of four AA batteries (the radio takes 3), that figures out to 4.5 cents/hour which is excellent. This figure differs greatly from that given in the 1994 Passport (25-30 cents/hour). I have no explaination for the difference but I stand by my test values.

Would I recommend this radio to anyone? If you do a lot of band-scanning, forget it; it will drive you crazy. But at about $140.00 plus shipping (NYC mail-order) it's an excellent "second" radio to carry around for listening to the major broadcasters. I like it!

****
Realistic DX-440 - 2

I have a DX-440 and I think it is a good 'dabble' radio but if I ever get serious I will look for a > $500 table model.

I love this radio! It's my main radio and I use it exclusively at home, moving it from room to room. It really is too large for travel

I've found the sensitivity to be tremendous on SW, MW and FM! Very rarely do I need to attach a clothsline antenna! It has continuous SW coverage, a great sounding speaker, BASS and Treble controls, two bandwidths, great sensitivity, good spurious signal rejection...It has all the features I wanted in a starter radio! I bought it about three years ago on sale for $150.00! I still

don't know why Radio Shack discontinued it. If you're
looking for a good starter shortwave radio and can still
find one laying about at a Radio Shack store priced to move,
GRAB IT!

****
DAK DMR-3000 - 1

I bought this radio since they have a 30-day money back guarantee
and I did not know if I would like the hobby or the radio. Good
points: direct-entry tuning, 36 station memories, fairly small so
it is easy to travel with, speaker sound was good, reception was
okay, but improved dramatically with the addition of the Radio
Shack 23' rollup longwire ($8.95). Bad points: only 5kHz tuning
steps, only major broadcast bands tunable (large gaps between
bands), selectivity not so good, no fine tuning, no BFO, no SSB
or CW, poor FM reception. All in all, not a bad radio of $69.90,
however, it left me wanting for more, so I got rid of it.

I have seen a couple of posts asking for a low cost SW receivers.
I have recently bought a DAK Model DMR-3000, for just
$69.90+$6.00 shipping from DAK - a mail order company.
The receiver has a direct access, so you can type in the desired
frequency, and a manual / automatic scanning system. It also has
a dual time clock with alarm and 'sleep' timer. Unfortunately you
can tune only to the commercial frequencies on SW, AM and FM
bands. I have to say though that cheapness comes at a price. The
first receiver I got was defective so I had to ship it back and
ask for a replacement. Now, I received a new one which works very
well.

Compared to my Sony ICF-7601 the DAK unit is an insensitive
brick. The fancy clock and timer features aren't really worth it.
About the only thing nice is the FM Stereo support if you plug in
headphones but the FM sensitivity leaves much to be desired as
well.
Something else to watch for.... That pretty lettering on the
buttons will wear off REAL fast. If you haven't used it much yet
you won't see a wear off REAL fast. If you haven't used it much
yet you won't see a problem. After you've done some tuning you'll
see the pretty arrows disappear from the buttons.

****
Sangean ATS-803A - 1

Since I was now turned on by SWL'ing, I moved up to what most
people agree is the best all-around radio for this price. Good
points: excellent frequency band coverage (150kHz to 30mHz), fine
tuning, good selectivity, BFO for SSB and CW, many scanning
options, lots of accessories included, good AM and FM reception.
Bad points: way too big to travel with, high battery consumption,
synthesizer noise in background all the time, scanning frequently

skipped lots of "listenable" stations that I was able to get by manual tuning (what's the use in scanning, then?). I found that adding a longwire antenna only increased interference and noise while not improving the set's scanning sensitivity. Overall, a fairly good radio for the price...

I have a Sangean ATS803A which I love. Comments to quote me on would be that it's an excellent beginner's radio for the price. Although I've heard that the 818 is the "latest and greatest" in this price/performance category. I especially love the full coverage 150kc-30mhz and the (albeit lo tech bfo) SSB capability.

****
Sony ICF-SW20 - 1

I was in dispair when I could not find a decent travel portable for under $200. However, I accidentally crossed paths with a Sony ICF-SW20 on sale (normally $99, on sale for $49.99) at a local store and had to check it out. It is an analogue set, but since I got a 30-day return policy on it, what the heck? Good points: analogue tuning so no problem with confining 5kHz tuning steps, INCREDIBLE SENSITIVITY - this radio blew the DAK and Sangean away with the number of stations I picked up, good selectivity (no fine tuning knob - all you need to do is turn the tuning knob slowly), tiny size (4"w x 3"t x 1"d), small whip antenna (only 18"), addition of Radio Shack rollup longwire increased sensitivity even more, great low price (if I lose it or its gets destroyed, no problem replacing it), tuning bands are wider than the major broadcast bands, so you do get some utilitiy reception as well as WWV, AM and FM are really sensitive while FM goes from 76mHz to 108mHz so I can pick up some TV as well. Bad points: frequencies cover only seven broadcast bands (I can live with that, though), only monaural earphone included (however, you can get a $1.39 mono to stereo headphone plug), no BFO for SSB or CW, no station memories. All in all, this radio gave me the best price/features/size ratio of the ones I checked out first-hand. It's a keeper for me!

****
Magnavox 3625 - 1

Finally received my Magnavox 3625! Well, I'm certainly happy I purchased this little radio. Sure, it's not top shelf, but it's suitable for travel purposes and gives adequate SW coverage.

Has these features:
Travel Lock
Alarm (beeps, does not turn on radio)
Sleep Timer
9/10 KHz switch - for world travel
12 hour clock (however, when unit is swith to 9 KHz steps 24 hour

clock kicks in)
20 presets - 5 for each band FM, AM, SW1, SW2
Dual time
Auto store - this feature allows the radio to automatically find
the five strongest stations in an area and program
them into the memory of the FM & AM band.
Back stand
Antenna swivels and rotates
Runs on four AA batteries.

Well, the sensitivity is quite good. Steps in 1 KHz increments.
No tuning knob but the slew tuning buttons work just fine. It's
about the size of a paperback book and can be taken anywhere
reasonably well. No carrying strap,
though. The SW coverage is limited but it grabs the major
broadcasters exceptionally well. Example: the 41 meter band is
covered from 7100 to 7300. So if you want to listen to the BBC
on 7325, you're oput of luck.

However, I like to listen to the BBC on 12095 or 15070 European
signals during the day that I cangrab when I attach a long wire.
The 3625 can't tune these freqs. but it can grab 15400 (from
africa) WITHOUT a long wire antenna! I'm pretty impressed.

Bottom line....A GREAT little travel radio for $70.00! Call a
Magnavox outlet if you are interested.

****
Magnavox AE-3805 - 2

Great little digital portable. Good sensitivity, average
selectivity. Covers MW (in 10 kHz steps only), FM (no stereo),
and SW in two "bands": 3200-7300 kHz and 9500-21750 kHz. Built-
in timer/clock (12 hour format only), 5 programmable memory
locations per band. Great for travel use.

Purchased from Damark for $49 in May, 1993.

$50 from Damark closeout -- cheapie category

****
Emerson PSW-4010 - 1

Great analog portable. Good sensitivity and selectivity. Covers
MW, FM (stereo through headphones), and SW in 8 bands (roughly
split out as 13m, 16m, 19m, 25m, 31m, 41m, 49m, and
60/75/90/120m). An excellent travel portable.
This is the same radio as the Sangean SG-789.

Purchased from DAK for $49 in June, 1988.

****
Sony ICF-5900W - 1

Sony ICF-5900W was a good radio in its day, but isn't worth
listing now.

****
Icom IC-R70 - 1

I purchased my R70 in early 1983. It came with a scratched plastic
window for the digital display, which the factory replaced. It is
an extremely sensitive receiver. I installed the FM detector board
option, which is highly useful for Sub-Carrier detection from FM
broadcast receivers in conjuction with the R70's ability to tune
below 100khz without a frequency convertor. The so-called PassBand
Tuning (PBT), in actuality an asymmetrical bandwidth narrowing
control, is very mediocre with the factory 455khz filters. Replacing
the 455Khz ceramic SSB filter with a Fox-Tango FT-44 2.4khz 8-pole
crystal filter (equivolent to the ICOM FL-44) makes the passband
filter work as one would want. The AM 455Khz ceramic filter is junk,
and was replaced with a higher quality "4Khz" ceramic filter from
the long-defunct Radio Plus firm. The actual specs for the 4Khz filter
indicate that it is a slightly asymmetrical filter of 5.6Khz bandwidth,
causing a slight degredation of the "highs" (The original spec is
for a 6Khz bandwidth; the 9Mhz AM filter is a 6-pole device). Inclusion
of both replacement 455Khz filters results in a combined shape factor
of much better than 2:1 on AM or SSB. In addition, the RF amplifier
was enabled for AM broadcast band use, and an MOV was placed across
the AC input for protection against voltage transients. [Actually,
a Transorb would be far better in defending against narrow transients.]
For awhile, I replaced the diode AM detector with a Shottkey diode,
but my ears could detect no difference in distortion, and so the
original AM diode was returned to the circuitry. It's been serviced
once by ICOM for an intermittant problem ($150 ouch). There exists
several modifications to enable selection of the 455Khz SSB filter
whilst in AM mode for additional selectivity.

Drake R8 - 1

****
Drake SPR-4 - 1

****
Icom R-71A - 2

Eskab & Edvis of Sweden used to offer a Phase-Locked AM (PLAM) detector for
the R-70 and later R-71; they also offer a version for the NRD525. I have
the R71 version. It is a synchronous detector which allows selection of USB
or LSB via the IF filter/BFO offset. The PLAM board phase-locks one of the
R71 local oscillators (I forget which one, probably the BFO) to the AM
carrier. It contains its own product detector. The lock range is not very
large, perhaps +/- 20 Hz. The detector seems to have lower distortion than

the ICOM AM detector.

Compared to ECSSB, aside from the advantages of phase-locking the product detector BFO, the PLAM unit also lowers the corner-frequency of ICOM's low-pass audio filter, giving better bass response than normal SSB mode on the R71. I find that this improves the intelligibility of the signal.

The PLAM board piggybacks in the mounting area for the ICOM FM option board; both can coexist. Installation is somewhat difficult, as it involves connecting over a dozen wires to various boards in the R71.

Eskab & Edvis also offered a 4 KHz 2nd IF crystal filter for the R71. This installs fairly easily in place of the narrow CW filter. It is very much better than the stock ICOM 6 kHz bandwidth, which is wide-open until it hits at cheap ceramic filter in the 3rd (455 kHz) IF.

I don't know if Eskab & Edvis still offer the R-71 PLAM and 4 kHz filter. They used to advertise in the WRTH.

Regarding other options: I believe Sherwood Engineering offers an outboard synchronous detector for the R71 as well as other receivers. The Kiwa MAP unit should also be adaptable to the R71.

Also, Dom Moman of Shortwave Horizons publishes a modification manual, which details mods like enabling the preamp on MW, true pass-band tuning, sub-10 Hz RIT, etc.

Kenwood R-2000 - 1

****
Kenwood R-5000 - 1

****
Kenwood TS-450-1

I know it's not a reciever, but since it has general coverage,I decided to put it in here.The TS-450S iaN amateur transciever that costs little more than a R-5000,and if you have your ham ticket or are thinking about getting it,may be worth checking out if you are in the market for a new toy.I'd be willing to bet the replacement for the 5000 will look just like the 450,just like the 5000 looks like the 450's predacessor,the TS440S.First thing it is EXACTLY the same size as the 5000/440.Unlike the 5000/440,it has an LCD display that is unlike any other I've ever seen.It is almost too bright!The brightness cannot be adjusted,unfortunatly.The 450 recieves in all the standard modes except for fax.It has a"normal"keypad unlike the 5000 and the aggravating CW that is producewhen a major button is pressed can be silenced by y -a simple menuss,you dont have to cut a wire like the 5000he S-Meter is a bar-graph type that I like but some people dont.It also has an Audio meter function that kin baffles me.I still dont know what use it is,but it looks nice!Probably the most notable thing you will observe when using the 450 is the QUIET!It is so quiet,it seems strange the first couple of times you use it.The AGC is non-defeatable and has a fast/slow toggle.It is the strangest

and slowest AGC I've ever seen,on slow the S-Meter just sits there and then SLOWLY goes down.On fast,it just isn't quite so slow.It seems to work ok,but is really odd.The stock filter for AM is a mile wide but you can add the YK88 AM filter but you wll lose the open slot for the 8.83 ssb filter.I'm not sure,but the 450 seems to have the same stock am filter the 5000 has.On SSB,it uses one of the better Murata ceramic filters and is ok but the optional SSB filters are highly recommended.The audio is FANTASTIC on all modes and if you put one of the minimus speakers from Radio Shack on it,you will like it a lot.Dont bother with the Kenwood speakers,the one that goes with the 450 is not too good and is expensive too!The ergonomics are pretty good,except for the tuning knob,yes like all the recent vintage Kenwood rigs,IT DOESN'T HAVE A FINGER HOLE!!Why does Kenwood insist on putting these awful knobs on all the rigs they have made lately!All in all,it is a very good riever in almost all respects,and since t it only costs about $100 more than a 5000,it is worth a lookND as a bonus, the recieve coverage goes up to 40 mhz!If you are into low band scanning,you will hear things on the 450 you never knew existed on your scanner.If you can swing the 450's sister model the TS690,you can recieve all the way to 60 mhz. When the 5000 is put out to pasture,if it's replacement is the 450 without the transmitter,it will be very tough competition for the other makes.All it needs is Sync.detection and you really couldn't ask for much more.

****
Japan Radio Company NRD-515

THE all time most user-friendly recieveof recent vintagHas PBT,analog fine tune,four I.F.bandwiths,AM,LSB,USB,and RTTY modes.There is no squelch but it really doesnt matter much.Of all the recievers I have owned,or ad over here to play with,it is the most sensitive in the SSB modeI have the standard 6 and 2.4 khz filters,and th600 and 300 hz filters whitch are great for RTTY or CW(if you are truly desparate!)The "protection"diodes have been removed due to intermod from a local AM station.The reciever's case,front and back panels are made of Aluminum,no plastic to crack on the 515!The audio in AM is very bad,almost as bad as the Icom R-71a,but in a different way.The audio is "fuzzy"out of the speaker jack,but not too bad out of the record jack but still a little "fuzzy".In the SSB modes,the audio is pretty clear and doesn't fatigue me like the Icom dos far as thergonomics goes,it's almost prefect!All the knobs are the right size,the tuning knob is large and has a nice deep finger hole(Kenwood,are you listening???).The S-meter is big and easily seen across the room.Dynamic range is very good after the diodes have been clipped(a one minute operation).The filters all are good quality and have good shape factors.This was the first "affordable"rig that had a memory option that was worth something with 24 or 96 channels available. The NDH-518 I have(96 ch.)is also made totally out of cast and sheet aluminum and matches the 515's styling.It stores frequency only,unfortunatly, due to the year it was designeIm guessing.There are lots of these recievers floating around on the used market for about $600 or so.Universal seems to have a lot of them passing thrgh the store.

****
Japan Radio Company NRD-525 - 1

This is a great reciever,marred only by bad audio and a hiss that will drive
you bonkers if you have good hearing and a speaker that can put out the highs.
I have had two of these,the first I traded for a sateite setup,and the one I
have now.The newer reciever has mucbetter audio then the first one and lesess
hiss too.Ergonomics are very good MUCH,MUCH better than the Drake
R-8.(IMHO,the Drake is seriously overrated and all the stuff about made in the
U.S.A.is kind of funny cause a LOT of the innards are MADE IN JAPAN!!!)Oh
well,back to the 525,if you are into AM,it's probably not the reciever for you,
but in allthe other modes,it is one of the best consumer grade recievers ever
made.Performance in all modes is basically excellent except fothe audio pr
problem,and stability is rock solid.JRC has only cut a few corners compared
to the 515,probably the ultimate in construction for consumer recievers.
The case is made of very thin sheet metal and the front panel is plastic.The
keys fit loose in the keypad but work ok.The display has four brightness
levels and is very easily read from across the room.The S-Meter is "digital"
and is a floating vertical bar segment that seems to be yellow on some samples,
and green on some others.It is sort of "spastic"and twitched a lot on the
first one I had,but not as much on the seconone.The first 525 I had would
"click" on strong AM signals,but the new one doesn't.The main tuning knob
spins very smoothly and has a nice finger hole.(KENWOOD,WHY DONT YOU LISTEN!!)
All in all, a great reciever.

****
Japan Radio Company NRD-535D - 2

I have been using a NRD-535 for two years and i am very pleased
with it. Although the relative high price makes this a radio
for the serious DXer and maybe not the average Shortwave listener.

The NRD-535 has very good ergonomics. It is very easy to operate
during long listening passes. It has 200 memory channels which comes
in handy for storing interesting frequencies that you want to
check later, or stations that you want to check regulary.

+ side:
On the plus side there is the BWC and the very good sensitivity.
The BWC combined with the PBT makes it possible to make
a station readable that is very close to another station, or
a interfering RTTY transmitter. I find that i mostly uses
the SSB mode and zero tunes the station, and then uses the
BWC and PBT to get the most readable signal. The BWC and
PBT has saved a lot of reports for me. The sensitivity
is excelent. It is among the best in this price class.

- side:
The audio in the built in speaker is mediocre to put it mildly.
A station that you read loud and clear in the earphones can be
inaudible in the built in speaker. The selectivity is not as
good as it could be. The NRD is very sensitive for splatter from
nearby stations, and this can totally drown the station that you
want to listen to. The ECSS option that you can equip your NRD with
is a joke. I have it installed but i NEVER uses it. The only time
you can use the ECSS with any improvement of the signal, is if the

received signal is strong to begin with. Don't waste your money on the ECSS.

The conclusion is that the NRD-535 is a very good receiver for the serious DXer but it has some shortcomings. The 535 is much better than the Icom R-70 that i had before, and i would recommend it to anyone that asked me. What you might want to do is change the filters to somewhat sharper filters. That goes for both the 9 MHz and the 455 kHz filters.

****
Yaesu FRG-100 - 1

****
Panasonic RFB-65L - 2

$220 from Universal, EEB, etc. -- my main set, an excellent portable, many features, nice construction and details.

****
Sony SW-55 - 2

This is my principal radio at the present time (I also have the Sony ICF-SW33 and the Sony 7601). This rig is an extremely sophisticated piece of equipment. I especially like the fact that you can store up to 125 frequencies on 25 electronic pages that can be named as you wish (by country). Once programed this is very convenient. The two filter selections are well chosen (much better than the stock Sony 2010 filters). My use the radio to copy WEFAX with excellent results attests to its stability (and that it receives USB and LSB).

The versatile timer/alarm and tape remote feature allow automatic recording with certain tape recorders (Sony and others) of up to five times and frequencies in a 24 hour period. I use this feature all of the time. Audio (stereo on FM) qualitity for a portable is very good; better I believe than the stock 2010 although as with the 2010, it is improved with a set of external speakers.

Unlike the 2010, the SW55 does not have synchronous detection. That's too bad because I believe that if it had this feature it would blow away
tition. As it stands it is an excellent radio. Most interference can be eliminated with the narrow filter or moving away from the interference a bit (the radio is tunable in steps of 0.1 kHz) so the lack of sd is not critical. I really believe that Sony did not include it because it would have then had a very negative impact on sales of the SW77.

Would I buy this radio again. You bet! The only problem I've had in the year an
owned it is that the lettering has worn off the 1, 5, 0 and EXE

keys on the keypad. That should not happen on a $300.00 radio!

I just got a SW-55 for Christmas and find it to be an outstanding radio. Now that I've said that, you should know that I am new to all of this "DX-ing" (is that how you say it?). However, I can tell you that it's reception with the built-in antenna and with the included auxiliary antenna is very good. I found that the radio comes pre-programmed with a number of stations (BBC, Radio Moscow, etc.) and they come in great.

As for your questions, I've found the speaker in the SW-55 to be very high quality, delivering plenty of volume and good sound. There are several "tone" switches (news vs. music setting, etc.) that enhance the reception and its sound. And, the unit is packaged well for travel.

The radio itself has several nice features (I don't know how they compare to other radios since I didn't comparison shop). There are several output jacks that make it easy to connect to external speakers, tape recorders, headphones, etc. There are local/long distance antenna settings. There are lots of ways to set and look at the time (local, UTC, Daylight savings, etc.) There are alarms and sleep settings (for on the road).

The tuning portion is quite nice. The radio of course offers digital tuning (punching numbers in to get to a freq.). But I find that I often use the "analog" tuning dial as well to either fine tune a station or to see what else is out there.

Best of all, the unit is packaged well. As a new user, I have enjoyed the little things Sony has done to make this experience a good one for the new user. Everything from the documentation to the carrying case has made it quick and easy for me to start listening to short wave. Included is a book that is a publishing of all the various countries broadcasting, with their freqs and times. (I gather that these things change quite a bit, but I presume that Sony updates it often)

****
Philips AE3905 - 1

In short, in my experience, the AE3905 is no real great shakes. It looks neat as hell, and marks its owner as a man of taste and distinction with more money than brains (like I said, *I* have one). Its shortwave performance is mediocre. Using this in a hotel last February, I found that attaching the included reel antenna caused the radio to overload fairly badly. The batteries don't last very long. The filters included are fair, but you still get a fair amount of interference from adjacent stations (not as bad as some small portables, but not good). I certainly wouldn't want to use this as my primary radio. For portability, it's fantastic. I can listen to the BBC or VoA anywhere. The radio fits in my shirt pocket, although reception in my pocket isn't all that good. In short, the radio isn't worth what Philips charges for it, but if you've got more money than you know what to do with and a desire to have a flashy looking toy, it'll do.

The radio has only recently been available in small quantities in the U.S., and appears to have been discontinued in Europe. I got a reconditioned copy for $179 from the Magnavox factory outlet in Kentucky. Universal lists the radio in their catalog for something like $250 new if I recall correctly. You're not likely to find it anywhere else.

****
WATKINS-JOHNSON HF-1000 HF RECEIVER

I will be doing a lot of comparisons to my other receiver, an NRD-525. To give a basis for comparison, the NRD-525 has been upgraded by the following modifications:

ESKA PLAM board with four added filters following the IF strip
Installation of ESKA Aux filter in the NRD Aux position
Installation of the JRC 1.8 KHz filter in the Narrow position
Replacement of RF chokes on the filter board with shielded units
ESKA agc modification

These modifications have improved the shape factor on the NRD's filters from an average of 2.0:1 to 1.7:1 (60:6 dB). The ultimate rejection has improved from about -60 dB to -75 dB. These modifications are noticeable in on the air listening tests. The NRD hiss has been removed.

About two months ago, I bought another receiver, a Watkins-Johnson HF-1000. I didn't really think this receiver would be much better than the NRD, and I intended to return it if this was the case. I was wrong. The Watkins-Johnson receiver is clearly superior to the NRD in on the air listening tests, almost in every case. In rare cases it is a tie. The comparisons are done using an A/B switch that switches both the RF and audio lines so that comparisons can be made quickly on the same signal. Comparisons were all done in ECSS mode with the receiver settings made as close as possible to each other.

I also did some bench testing of both receivers, and the numbers that the tests give are not all that much different for both receivers, with the exception of filter shape factor. The HF-1000 shape factors run about 1.1:1 (60:6 dB). This does not explain the main difference between the comparisons, however. The HF-1000 seems to be superior in pulling out weak signals. I have heard many signals that are muddled and hard to understand on the NRD-525 sound sharp and clear on the HF-1000. Several other points:

AGC: The digitally processed AGC on the HF-1000 is far superior to the analog AGC on the NRD, even with the ESKA kit installed.
Notch filter: Again, the digital IF notch filter is superior.
Audio: The NRD audio has always sounded low frequency and mushy; audio on the HF-1000 is crisp and clear. This is an important item.
Operating: I like the controls on the HF-1000. They are flexible, yet easy to use. The set is a pleasure to operate.
Synthesizer spikes: The NRD has a synthesizer spike every 100 KHz. While these are not all that strong, some of them fall on inconvenient

frequencies, like the propagation beacons on 14100 KHz. There are
a few spikes on the HF-1000 at even 2 MHz points.

The only shortcomings in the HF-1000 I've noticed are the lack of synchronous
detection (this is supposed to be sent out as an upgrade chip later), and
IF passband tuning would be useful in the SSB modes. It is present in CW.

As you have probably guessed, I'm real happy with this receiver. I think
it will be the last one I will have to buy for quite a while.

Watkins-Johnson HF-1000 Review Part 2

Watkins-Johnson SAM option for HF-1000

Recently I received the firmware for installing Synchronous AM
(SAM) detection in my HF-1000 receiver. I was able to install it in
about 1/2 hour and it worked great. In testing it I compared it to the
ESKA phase lock AM board installed in my NRD-525. Here are the results
for strong and weak signals:

Parameter	ESKA+NRD	HF-1000+SAM
Weak signal lock range	+- 20 Hz	+-250 Hz
Strong sig lock range	+- 40 Hz	+-900 Hz

As an on-the-air test I tried to lock onto Radio Pyongyang, 13760 KHz at
1300 UTC. The signal was weak and fading rapidly at 1300 UTC and was being
broadcast on 13760.1 KHz. The HF-1000 was able to lock it immediately even
when set to 13760.000. NRD was not able to lock it at all, even when set to
13760.1. Impressive!

Another modification in the new firmware is a change in the AGC function.
It is now possible to set three decay rates from the front panel for each
AGC setting, Fast, Medium and Slow. In addition it is possible to allow
the manual gain setting to control the AGC threshold while in AGC mode.
This is a great help for the AGC control. I spent many hours trying to
get the AGC decay rates correct on my NRD receiver, and was never happy
with that AGC. This required pulling out the IF board, replacing some of
the SMDs, putting it all back together, and then trying it. Digital AGC
processing on the HF-1000 makes this a snap, taking only a few seconds.

After several months of using this new mode of reception, it is the one
I nearly always use for SWLing and DXing. For weak AM signals it is hard
to beat. If the signal is readable at all, it will be able to lock on it.
By using both sidebands, you end up with a better signal to noise ratio
than with only one sideband. The HF-1000 is even more impressive now
with this addition. The only times that I have had to resort to ECSS on
AM signals is when there is interference on one sideband. Watkins-Johnson
reports that they will have single sideband SAM in the future which will
get around this. There are several other options that they are working on,
one of which is a plug in board for PC processing. I assume this will have
real time spectrum analysis and memory functions built in.

****
AR3000 - 1 (More Info is Available by e-mail from (jlloyd@cs.clemson.edu)

My general impression, is that this is anyhow a very good apparate. It offers continuous coverage 0.1 : 2036 Mhz, all mode, RS232 interfacing, quite good operating commands, triple conversion, 400 memories; it is very compact (small tabletop, 1.2 Kg.), semi-portable; its 13 auto-selected front-end band filters reduce to some extent unavoidable intermodulation. In general, this set offers a self contained and very well balanced compromise of a lot of different demanding features, but will show its best when fully interfaced.

Its price, here in Italy, has been varying greatly during the years. Therefore I cannot say how it really competes with the choice of HF receiver + scanner setup. It is still unclear to me how far is the AR3000 from dedicated traffic receivers.

I'm finding a number of defects and "whish it was" that I'm going to list (I would like to hear comments about), but perhaps I'm just pretending too much from a receiver in which something had to be traded off between versatility and performance. Please note that I have a 4 years old AR3000; some defects could have been amelio-rated in the 3000A, or may eventually be specific of my unit.

Hardware limits:

-AM selectivity is mediocre (approx 10 khz bandwidth). I feel the lack of a variable Am bandwidth. SWL in crowded bands is too often spoiled by the 5Khz whistle. Thinking it was a problem of i.f. detuning, I once sent it to the service to have it retuned, but with no perceivable gain.

-In AM I do experience blocking. A strong transmitter mutes any weaker adjacent signal lying some -+30 khz apart. I suspect this may be rather a problem of AGC voltage (see below on squelch), because the feedback signal is obtained from the previous to the last i.f. stage, which may have a larger than necessary (for AM) bandwidth.

-The squelch control (essential in search mode) is not very functional. On my set almost everything passes for knob positions below .3 and only >S6 passes when I increase to .5. It may be a problem of adjustment, but also reflect the inaccurate behaviour of the S-meter, which (I have no measurements to support) seems not properly logarithmic. I have the impression that weak signals give a high S readout when close to stronger ones, because the S-meter averages on a larger bandwidth than the demodulator.
Also, the squelch just mutes the a.f. output, but not the line out signal.

-The internal speaker fidelity is scarce. No tone controls exist. Clarity improves a lot when connected to an external speaker or lineout. No noise reduction circuitry is present. External audio equalization does a lot, but of course is not the cure for low selectivity.

-There is no i.f. direct output for say a spectrum analyzer or a different demodulator (say wide band AM for satellite or TV, stereo FM decoder, sinchro SB AM decoder). A modify could be to buffer it to a backpanel jack.

-Intermodulation IS present. I live very close to power MW transmitter, and in the times they're on the whole band .5 : 2.5 Mhz is unusable, with crosstalk on every possible combination of transmitter frequencies. At evening I sometimes hear sw bc stations crosstalks on 20 : 30 Mhz, even with a short random wire antenna. However, I don't hear crosstalk due to FM transmitters, which are also close to my place. The 13 front end filters seem to do their job, since strong signals don't cause crosstalk out of their respective preselector bands.

-I'm not very satisfied with the small and clicking rotary tuning control. In the AR3000a it has been replaced with a (I guess optically encoded) smooth one. I would rather appreciate a jog-shuttle like the one on VCRs, and the mod itself seems quite easy too.
The tuning is however digital, and stepping frequency causes clicks, which eventually trigger the squelch threshold during search. The final a.f. is briefly muted while stepping, but I prefer the line-out signal which is unaffected and thus has a faster response.

-There is a single antenna input for the entire range. I think this however is correct, because whichever choice on different antennas is entirely dependent on the user setup, and should be rather left to an externally programmed antenna switch.

-Some digital RFI is generated, expecially in the high HF and low VHF. A real antenna connected with a shielded cable and a good earth however wash it out.

-Some small change in sensivity and background noise can be perceived when passing across one of the 13 band boundaries (by the way, they are 0.1-0.5, 0.5-2.5, 2.5-10, 10-30, 30-50, 50-108, 108-136, 136-174, 174-224, 224-335, 335-500, 500-940, 940-2036 Mhz), but this is unavoidable, and also due to the change of the superetherodyne scheme.

Software limitations:

-Scanning is already very versatile for such a small machine. However, auto memory storage of catched frequencies was forgotten. Also, the oddities in the S-metering (see above) impose manual choice when scanning non regularly channellized bands.

-There is a priority channel lookup feature, but the attention threshold has to be the current squelch position. Apparently (see
//ftp.funet.fi/pub/dx/receivers/mods/aor300.mod) in
the 3000a a programmable lookup time was implemented, but it is not present on the 3000.

-The mode and the tuning step change are set with several keystrokes. I feel it quite tricky, expecially considering that I generally have to switch quickly between 50 Hz/SSB, 500Hz/Am, 1.25 Khz/nfm, 50 Khz/WFM. The step x10 command is

very useful, but not enough.

Since the S-meter signal is output on the RS232, and the unit may be fully remotely commanded, all this limits can be cleverly threspassed by an external control software, thought.

I have experienced problems with the 232 interface. The cpu goes crazy very easily when the connector is plugged in/out, unless the "remote" switch on pin 7 is previously operated. This is (I understand) the reason why it was added on the 3000a. When the cpu goes on the moon, one generally has to open the set and to push the reset button (backside of the keyboard), losing all the memories .
Also, I cannot interface the scanner with an Atari St, either because the TTL level Txdata is to low for that serial port or because the continuous output of the S-meter simply is too fast for the Atari bios.
Passing by, note that the RS232 speed can be set to 9600 baud with a switch on the cpu board.

There is a voltage anomaly due to the circuit design around one of the
regulators. AOR has distributed a fix which involves soldering a simple
diode across a 1-meg resistor. This fixes the problem; all future
shipments should have this installed (until the next board rev comes out
and it isn't nexessary).

Sounds like you were looking at the Sony PRO-80.

Not quite the coverage you mention but 100KHz - 223MHhz and 40
memory channels. VHF Coverage provided by use of a Convertor box
that had to be fitted on top of the BNC antenna connector.

They also did the AIR-7 (or AIR-8 in the States) which looked the
same but did not have SW coverage. That dios not have "Hi-Scan" on
the speaker grill though.

Most, if not all Sony dealers should be able to help you. Its
still in the Sony product list.

The antenna might overload the Pro-51 if you live near major cities. I live on a hilltop 25 miles north of Baltimore, that's my problem. The 2006 works great w/the antenna, the Pro-51 gets some overload. Try an extended rubber duck antenna like the Diamond RH77CA. I use it for both my 2 meter HT and the Pro-51 and it makes an amazing difference (about 15 inches over all and very flexible). I wouldn't use telescoping types of antennas; too rigid and you can break the BNC plastic mount.

BTW, the Pro-51 doesn't have overload problems in the 29-54Mhz range, just everything above. By overload I mean you'll get lots of images, but the range is improved greatly.

Instead of using the 29.95 RS multiband, how about the cheaper 19" scanner antenna they sell for 17.95? I have that also and it doesn't overload the scanner nearly as much but does increase the range tremendously. The advantage here is the shorter vertical element AND being mounted as high as possible. Use RG-8 cable and a short length of RG-58 (2 feet) w/approp. adapters for the Pro-51. Hope this helps and happy scanning!

Andy

Source record: 269339

For all the American readers whos supply of modifiable Pro-43's are drying up, can I suggest a new supply. Canada. I was at my local radio shack today and checked the date code and serial number on the Pro-43 on the shelf and it was 9A3 and the serial number had *NO* "A" at the begining. The serial number was actually in the low 60,000's. The price was $469.00 can. or about $325.00(?) U.S..

We also still have Pro 2006's in stock at $539.00 Can. or $377.00(?) U.S.

So if you miss out on the local stock just do a bit of X-border shopping. :-)

Dennis

P.S. I'll let you all know when (and if) the 43's and 2006's go on sale eh. :-)

1537. !SECRET! Airshow Frequencies???

Newsgroup: rec.radio.scanner
Date: 1994-09-02 15:49:51 UTC
From: dingman+@PIE9.MACH.CS.CMU.EDU
Message-ID: <347hiv$8cf@casaba.srv.cs.cmu.edu>
Source record: 269340
Cross-posted to: rec.aviation.misc,rec.radio.scanner

What's the secret? I just called two airshow locations to get their show-control frequencies, and in both cases was told, "I'm sorry, we don't give out that frequency." I spoke with folks at the airshow information number (not surprising that they wouldn't give it out) and at the operations number, and even the tower. No luck. So then I thought, okay, I'll call about the NOTAM and ask Flight Service folks about the freq. Nope, they only have the NOTAM and no frequencies.

Okay, so my question: Why don't they give out the frequency? It's not a major inconvenience since I'll have it ~ 5 minutes after I get there anyway, but I'd still like to know why this isn't given out!

By the way, I wasn't looking for the Blue Angels/Thunderbirds freqs -- I've already got a list of them to scan. :-)

Thanks!

Source record: 269358

The following was in an editorial of "Mobile Radio Technology" magazine...

"During the Surveillance Expo '94 to be held Aug. 8-12 in
McLean, VA, American Technology Associates and Ross Engineering
will demonstrate how legal equipment can accomplish what
lobbysists, legislators and FCC regulation-writers tried to
prevent: reception on cellular phone frequencies."

Included in the demo was a cellular phone itself, in "scan" mode.
Did anybody attend this? Did any lawmakers attend?

And before you ask, "Mobile Radio Technology" magazine is NOT
available to hobbyists. You must be an engineer or otherwise
involved in the mobile radio profession.

P.S. If you want to listen to fastfood resturants, check your frequency list for surrounding businesses. For example, Wal Mart uses 154.570. This is one of the freqs for Burger King, forcing the Burger King in the parking lot to use 154.600. Wal Mart was there first, and had first pick of the freqs.

They do talk about more than just burgers and fries. Especially when business is slow.

I dunno what it ws he was making but I would be surprised if it was
not amphetamines. No wonder Chuck would write stories like "monitoring
the Pot Cops" etc!

When his place was raided they confiscated his radio equipment and his
papers etc. Apparently some innocent folks that shared frequency lists
with him also got visits by the State Police according to reports I have
been told.

Better watch who you exchange correspondence with these days. I used to
live in a free country, wish it were that way still.

Actually with satellites and using DTOA (Differential Time of Arrival) techniques a transmitter can be located quite precisely. It is just a matter of spending the bucks to do it. In cases of satellite jamming (a la Captain Midnight/HBO) it is worth the time and energy to do it. If there was some major criminal etc using a cellphone, I suspect the Feds would play that card. I am not sure we will ever know all that was involved in the location and subsequent execution of Pablo Escobar but it was reported at the time he was located by his using a cellphone. Of course just knowing which cell sites were handling his traffic will get you damn close, but they could have used some pretty sophisticated techniques like I mentioned to get even closer.

Jimmy -

If you have a cassette player in your car radio, you can use a device
sold by Radio Shack (and other vendors). Looks like a cassette at one
end, of a wire, with a stereo 3.5mm plug at the other end. Design
purpose was to play portable CDs through the car stereo system, but
will work fine with other devices. You may need a stereo - mono
adapter for the 3.5mm plug.

Sorry, I don't remember the RS stock number.

If you -don't- have a cassette player in your car radio, but -do- have
outboard speakers, consider wiring a simple DPDT (or similar) switch
at the speaker wires. One position for the car radio, the other
position for the scanner.

Don't forget to check you local State laws regarding scanners in
automobiles.

Chris,

I guess it's their butt-headed mentality. I called a local Maryland control
tower to get their long/lat positions for a flight simulation scenario
I was developing and they refused to give it out (like anyone couldn't
drive over there w/a GPS unit in-hand). Perhaps it's paranoia, who knows....

Imagine a system of towers spread throughout the country that along with
their primary carrier service they also enclose electronically rotatable
antenna arrays used for remote triangulation of mobile/stationary
transmissions. Sound familiar? Seen these? Ooops, did I just give
something away? Me and my big mouth...

If you have a tape player, buy one of those CD Player adapters
that go into a cassette deck. Plug the wire into the headset
part of your scanner.

>
> Okay, so my question: Why don't they give out the frequency?

Chris,

I think it's because they don't want that frequency to get used (accidentally or intentionally) by people with TWO-WAY radios. There was an incident 2 years back at the Reno Air Races where some kind soul in the stands took it upon himself to direct traffic when two planes wanted different ends of the same runway during a declared emergency. Result...big, expensive plane in the weeds. Fortunately no damage, or injuries. At any rate, I think it gave the organizers a new appreciation for what might happen with hand held radios in the stands. Picture, if you will, someone setting their radio down in such a way as to depress the talk button. Nobody else will be able to use that frequency.

Generally I think people who own two-way aircraft band radios are smart enough to know about these potential problems and avoid them, but it only takes one to cause a problem. As you point out anyone who really wants to know will find out some way or other.

By the way, in addition to the airshow frequency you will find each performer, and each race crew has a frequency too.

I am looking to buy a handheld CB transceiver with scanning capabilities. Can anyone recommend a good mail-order source for one of these ? A used one would be OK too. I could prbably find one at my local Radio Shack, however, I have learned that the prices of Radio Shack can be a lot higher than mail order companies.

Thanks.

Layman's Evaluation of the Radio Shack Ni-Cd Charger/Conditioners
23-242 and 23-243

In the Health Crazed society we live in today, it was only a matter of time before someone became concerned with the health and well being of our dear friends, the NiCd battery.

The two chargers I am going to evaluate appear in the 1995 Radio Shack catalog. Each has its strengths and weaknesses.

These chargers are unique in that they first _discharge_ the batteries before beginning the charge cycle. This is important, as it will help prevent or eliminate the "memory" effect that plagues nicads.

First on the list is the 23-242 4 cell AA nicad charger.

Regrettably I lost the manual for this one so I can give you very little tech-nical data on it.

The charger comes as a self-contained unit. The entire thing pluge into a wall outlet. It has an indicator for charge and discharge, as well as a push button that begins the cyccle.

The process is totally automatic. You push the button, and it goes.
The discharge cycle runs for an hour, at which time charging begins.
Two hours later, (3 hours total) you will have four freshly charged nicads ready for use.

Observations: It is important to use the batteries in your device until they run "dead". The charger _appears not_ to totally discharge a set of batteries that are charged completely. The one hour discharge time is insufficient to do the job there.
Also, the batteries get rather warm during the process. I wonder if the high current used in the process in the long run may damage the batteries.
Also, it appears that the unit runs in a constant current state during the process. It sucks them dry, then slams them full of juice when charging. (I have not tested this, and cannot tell you the actual process used)

Advantages: The process is automatic... No need to watch over and pull the plug when the batteries are full.

In 3 hours your batteries are fully charged, ready to go.

Status lights to tell you what it is doing.

Disadvantages: 3 hours? Is that a little too much current being put to the cells?

You _must_ charge 4 batteries at the same time.

The unit _only_ accepts AA size batteries.

Next on the list is the 23-243 charger.

This unit is a 4 cell unit. It will attend from 1 to 4 AAA-D size cells in any combination, or charge 2 9 Volt size batteries. 9 volts take up 2 charging chambers.

This unit comes with an AC to AC adaptor, which plugs into the unit. This unit has 4 leds as charge indicators, and one LED indicating the discharge cycle. There is a slide switch that allows the user to select the discharge or charge cycle.

With this unit, the process is NOT automatic. You must select the process you wish to have it do, and you _must_ watch the time! This unit will overcharge batteries if you do not take them out when they are supposed to be done.

The manual says ALL batteries will be done discharging in 2 hours. Again, it will not totally discharge batteries put into it on a full charge. Use them first.
Also, it claims ALL batteries will be done charging in 7 hours. I have found AA cells are done in 6 hours, and 9 Volts in about 16 hours. I noticed an odor from the AAs after 7 hours.... Could this be an indication of overcharging? 6 hours seems about right, following a discharge cycle.

Advantages: This unit attends to all nicads, except N sizes.
This unit doesn't require you to fill all four charge bays...
You can charge one cell if you wish.

Disadvantages: The discharge cycle is timed. The charge cycle is NOT. You must pay attention to the batteries, and not let them overcharge. Not a unit to use while you are away in Nebraska on vacation :)

No automatic process switching. You must tell it if you want it to charge or discharge..

Overall Comments:

I had four cells on their deathbeds. One had a bad memory problem, and 3 were close. After using these units with them, all four cells _appear_ to have been returned to a regular service life. While, this is premature and I need to time their charge life to known good cells as well as do voltage tests, so far they seem to have been saved from the trash can for the time being.
I use nicads extensively. I have about 7 items I use very often that require the constant use of batteries. These units cut down on the time they need to be "cooking up", as well as give me the satisfaction that I

know I am getting a set of batteries all equally charged and ready to work for me.

Prices: The prices are about $17 for the AA charger and $22 for the larger unit.

Recommendations: Buy the AA charger if you exclusively use AA cells. If you have other sizes, buy the larger unit for them and _still_ get the AA unit for your AA cells. I have both, and they now have taken over all of my charging tasks, except for my 9 volts, which are kept in my old, regulated, charger after the discharge/charge cycle in the 23-243 unit is done.

This file may be distributed, provided it is kept complete, including the date of release, as well as my IDs.

DH> anyone really know for sure? Let's see some concrete evidence here.

David...
Just for clarification, it was the TDDRA that imposed the cutoff
date...not the ECPA.

There is that possiblity that some units were manufactured to be
non-restorable before April, 1994. There are several units with 3A4 that
are still restorable. The '2030 was non-restorable before April, as
reported on CompuServe Hamnet.

My feeling...on the '43, they manufactured all of the restorable units in
March to use up the inventory of the CPU's. I'm sure Tandy didn't want to
throw away good money by trashing the chips.

Unfortunately, I don't have any concrete evidence on this.

Agree - it works great.

Someone else suggested using something like a Rat Shack "Silent Play"
(an FM stereo transmitter/receiver pair; you can throw away the receiver)
to pipe the sound into the car FM tuner. There are numerous other gadgets
like this on the market, intended to let you do things like play your Walkman
through the FM stereo radio in rental cars, but the Rat Shack unit is by far
the cheapest. However I wonder about having a transmitter that close to the
scanner -- even though it's a very weak transmitter, it's also going to be
VERY, VERY close, and might cause receiver desensitization through front-end
overload. At $15 or so for the Silent Play it isn't that expensive to find
out...

Shawn4sk1 (shawn4sk1@aol.com) wrote:
: In response to RS having scanners w/no gaps.

: Answer: No, they don't. The FCC doesn't allow it.

Actually the truth is Radio Shack does not, but in Canada (InterTan)
or UK (Tandy UK), they _might_ and there is *nothing* to prevent you
from importing scanners from foreign sources.

Oh, oh, there are people who say its illegal, but don't listen to
them, there are also dealers who guarantee delivery or you don't
pay a cent!

Importing them is the way to go -- and with the scanner ban in the
US, it's the only way to obtain INTERNATIONAL models.

We need to spell out a message LOUD and CLEAR to the idiot dealers
in the US that they ARE losing sales, _not_ may lose sales, and short
of getting a rider on the next FCC funding bill removing the present
restrictions, that business in the U.S. will dwindle until it is
no more!

Additionally, *if* they were to attempt to stop imports, they would
need to change the law from banning import for use to banning import for
possession, which would get very ugly considering the number of
scanners already in the U.S. Furthermore, if this were to happen, I
would be all for getting the other countries to take action against
the U.S. with sanctions and other forms of action to discourage any
such discrimination of INTERNATIONAL scanning receivers.

What does it take to get a rider to remove the restriction on the
NEXT FCC funding bill? I mean if they are ordered to accept such
units into the U.S., they would have to change their rules (I think
they call it "amend") to accomodate them, right?

: A phone call to Tandy HQ resulted in an explanantion that the Pro-51
: warehouse stock was being sent back to the factory and being replaced
: with the keyboard mod left out (just a ROM change). They said the
: unit was not being discontinued.

** WOW! ** it IS modifiable, in that they can actually CHANGE the
rom at the factory (some low paid droids at Shack can actually
perform this task, wow wee!)

Ok, is it possible to dupe the ROM in the existing units, and post
the hex file (intel or otherwise) object code up here with info on
type of PROM needed to replace the new one with the code from the
older model? Or perhaps the bytes to zap for anyone worried of
copyright (not that it matters on an international newsgroup, I'm
shaking that the SS will be here on (C) violations!)?

This is getting more interesting.

I've got a new name for the FCC, the F*cking Communication Commission.

I know I ignore them, does anyone else? I'd like to see some of
corporate america flip the middle finger at them too and say here it
is, modifiable and for sale, what are you going to do about it? If
you fine us, we won't pay, if you harrass us enough we'll take you and

the issue to court, by the time we're done, your commission will be up!

We need to get organized and show the FCC we mean business -- meaning deliberate and intentional violation of their unconstitutional policies. We need to show them they are "elected" and not having a God given right to rule in such manner. Join me in deliberate and intentional violations of their dumb, stupid, unconstitutional rules!

Since I do not own a single transmitter, I have no need for any license or permit from them -- and as per receivers, that's none of their business! FCC -- go screw someplace else, another country preferably!

As has been noted once before (and editors notified), the freqs
for Hersheypark are incorrect in Beyond Police Call. The correct ones
are:
Security: 464.150 (repeater)
Security 2: 464.425 (talk around)
First Aid Talk Around: 464.375
Maintenance/Operations: 464.275 (repeatered)

Hope that helps some people out -- any questions or further inquiries
about the Park, feel free to email.

Cell phones can be has for $ 29.95 US, but they require a subscription to one of the cellular carriers. The more features you add the more $$$ you add :-)

I know it's illegal to monitor cellular but is it illegal to monitor cordless phones? I see all the scanners that can monitor cellulars being wiped out but I've heard nothing about cordless... Also, I'm sure this is a redundant issue for some but I have yet to know what the scanner bill entails... what it covers, what states will be affected, when it's liable to pass, etc... If you feel it is non-important to the others, please E-mail it to me directly...

Thanks In Advance!!!!

Shawn4SK1@aol.com

1573. faster 2006 scanning?

Newsgroup: rec.radio.scanner

From: shawn4sk1@aol.com
Message-ID: <348qpk$7um@search01.news.aol.com>
Source record: 269386

I know which diode and I know its effect in general but SPECIFICALLY- If I do get cut the diode and get the 2006 to scan faster, a)how much faster will it scan? b)will the speed button still offer a faster/slower option? and c)will it possibly cause me to lose alot of freqs I might otherwise catch, etc?

I figure the "c)" question is kinda a dumb one b/c I figure the idea is to be able to scan bands faster for the ability to cover a range quicker. BUT, I figure the original designer set speeds appropriate for the processor, etc as to be as fast as it could be under the design conditions- I figured if it could scan faster accurately, they would've made it that way to begin with... no???

Thanks In Advance!!! This is important as a soddering gun is not readily available to fix it if I'm disappointed by my surgery! :-)

I own the $29.99 RS magnetic mount antenna, but have it mainly mounted in my house. On top a of metal bookcase, on the second floor of my house, next to a window. My residence is near the top of a hill, in the north-west portion of Los Angeles, with the San Fernando Valley below. It works great for 99% of my purposes. But on aircraft, and some cellular, one side of a conversation you may hardly hear, usually the weakest radio, or farthest from you. Any suggestions to improve this?

Check out places like Office Depot and Office Max, and even Target etc.
There are a number of different padded cases/totes for who-knows-what that
fit nicely. I have one which simply carries the radio, antennas, and the
usual frequency books. Anything which is roughly binder-sized does well. If
you're really fancy, some of the hard cases for photographers would work,
where you cut the foam to fit whatever you're carrying.

Well, first I'm not a lawyer, just a 2L here in Dallas. Anyway, I suppose the state could argue that there was no fundamental rights encroached upon by the statute. If the court bought that, then the statute would be upheld under the "rational basis" review--the statute is rationally related to a legitimate govt. objective. On the flip side, the fed could argue that the statute falls beyond the scope of the police powers of the state & encroaches upon the FCC's jurisdiction. I'm sure I probably missed a bazillion other issues, but it's lateI'm tired & I haven't looked over my Con Law notes lately (that is the standard disclaimer for law students)

Anyway, usually the fed is hostile to state govt. encroachment. I havent looked at the FCC charters & rules lately, but I seem to recall that they included a proscription against cell phone monitoring and not cordless phone monitoring.
I guess the state could also argue that an additional ban on cordless monitoringwould be a logical extension consistent with the previous statute...

Here is the post that I saved a while back: (Try at your own risk!)

Article 13150 of alt.radio.scanner:
Xref: netcom.com alt.radio.scanner:13150
Newsgroups: alt.radio.scanner
Path: netcom.com!mat
From: mat@netcom.com (Matt Agren)
Subject: Motorola scanner how to
Message-ID: <matCtoyyp.HLC@netcom.com>
Organization: NETCOM On-line Communication Services (408 261-4700 guest)
X-Newsreader: TIN [version 1.2 PL1]
Date: Fri, 29 Jul 1994 07:47:12 GMT
Lines: 546

I have seen a lot of people ask if Motorola cell phones can be used as cell scanners.
Yes you can make you Motorola into a cell scanner and it is very easy.
The hardest part is grounding the right pin. Grounding this
pin will put your phone in test mode. On most flip phones there is
3 pins visible when you remove the battery. The center pin is visible but will not
make contact with the center pin on the battery. You must
have a rechargeable Motorola battery or a battery that has an metallic contact on
the center pin of the battery. To put the phone in test mode take a piece
of aluminum foil and role it into a strip big enough to fit
into the gap in the center pin on the phone. Make it large enough that it protrudes
above the plastic of the phone so that is makes contact with the center pin of
the battery. Make sure that it is not small and falls into
the phone! Once you have placed the foil turn on the phone
(unlock it if needed). Numbers are displayed 1
screen full then it quickly flashes to the next.

CHAN \/ PWR LVL
x x x x x x <--Rx Sig Strength, 00-99
SAT -->x x x x x x x <--1=TX Audio OFF
^ ^ ^ ^
1=TX on <-- : : : : 1=RX AUdio OFf
1=SigTone ON : : 1=Control Channel

Press the # key. The phone should display US , or something like that.
Now to scan cell phone channels you enter the following. when you enter
11xxx# the xxx = the channel number not the frequency. I will
provide a list of frequency to channel number at the end.

353# Select Handset audio path
08# RX Audio ON
11xxx# Three digit number, i.e. 11362#
474# Set to mid level audio
11xxx# Change to another channel

Be very careful with the rest of the codes because some could mess up
the cell system and some could erase your phone!!!!!!!!
The codes will work with all Motorola phones but grounding procedures differ.

01# Restart (Turns unit off and back on)

:
: Actually with satellites and using DTOA (Differential Time of Arrival)
: techniques a transmitter can be located quite precisely. It is just a matter
: of spending the bucks to do it. In cases of satellite jamming (a la
: Captain Midnight/HBO) it is worth the time and energy to do it. If there
: was some major criminal etc using a cellphone, I suspect the Feds would
: play that card. I am not sure we will ever know all that was involved in
: the location and subsequent execution of Pablo Escobar but it was
: reported at the time he was located by his using a cellphone. Of course
: just knowing which cell sites were handling his traffic will get you damn
: close, but they could have used some pretty sophisticated techniques like
: I mentioned to get even closer.

Certainly, but not with cellular stations. Remember that GPS uses one receiver to receive several satellites. Trying to obtain as accurate a position by using multiple receivers to receive one broadcast is a completely different thing.

Once you know which sell the person is in - simple direction finding gear can pinpoint them fairly rapidly.

: weeds. Fortunately no damage, or injuries. At any rate, I think it gave the
: organizers a new appreciation for what might happen with hand held radios in
: the stands. Picture, if you will, someone setting their radio down in such a
: way as to depress the talk button. Nobody else will be able to use that
: frequency.

Hardly. It would interfere, but not stop communication. The transmitters
in the control towers have far more power. The aircraft might not be able
to answer back - although that is also unlikely - but that could be lived
with until they got the idiot off the air.

I have just seen on the news today that Airforce 2 is arriving at Dublin airport on Wednesday 7th of September. Can anyone help me out with VHF/UHF frequencies for the secret service and any other agencies relating to the Vice President. I am a regular Mystic Star listener so HF is not a problem but never thought I would get a chance to listen to any of the VHF/UHF comms.

If anyone can assist please connect me as soon as possible either by this newsgroup of by email.

Thanks in advance,

Last week, Airtouch Cellular in Los Angeles sold Motorola reconditioned
phones (with warranty) which you could get for $25 WITHOUT ACTIVATION!
(or nothing with free activation). Many people rushed out to buy..

My opinion is that you're a great optimist. Sad thing is that
you're likely to be proven wrong by some of the bozo's out
there. When I was at a local vintage air show, I talked to the
announcer after the show and asked the same set of questions.
He avoided details but said that during one flight of a B-17
escorted by 4 P-51's and a P-47, some [....] in the audience
tied up the main comm channel by asking them to make another
pass because the light wasn't right for the last one to make a
good picture. He said that there's also idiots out there who
take pleasure in just doing stupid things like throwing a
dead-carrier on a live channel. He said they also got someone
who tried protesting the "desert-storm" war by switching
channels and announcing anti-war slogans.

I did get out of him that they have a list of freqs that are
used in order. If you find a dead carrier on a channel or
someone who doesn't identify themselves correctly, then you
switch to the next one down the list. The lists are derrived at
each "flight", practice and show, and are different each time.

How much of this is smoke? I don't know but I accept the base
theory that some people are twits. :<

JHKM> Oh, fine. I bought one based on the date code -- it says 3A4.
JHKM> However the serial number has an "A" prefix. I haven't tried the mod
JHKM> yet.

No kidding...you are the first one that I have heard where there is a
possibility that a 3A4 unit may not be modifiable. If you decide to try
the mod, let me know what you find out. That way, we can all correct our
information. In several scanner echos I visit, 3A4 and lower seems to be
the recommendation. If this is no longer the case, we would all like to
know.

JHKM> by the way, that "Monitoring Times" article you quoted missed the
JHKM> 54-88 restore mod.

I initially left it out because there are TV signals and pager signals in
this area for the most part. TV signals sound terrible with the NFM mode.
Also, there was a possibility that the unit needed to be re-aligned to
get better performance in this band. I went ahead and added this mod back
into the mod file.

Thanks, Jamie...
Jerry

Given that this is a warbird exhibition, it only seems fair that the radio work should include realistic simulations of war-zone radio procedures and counter measures, including electronic jamming, code-word ids, and secret frequency allocation :-)

More dangereous in some cases are instructions issued that sound real. If the tower failed to hear (say due to positioning on the ground) noone may have a chance to countermand it.

Getting the idiot off the air may take a long time. There was a case some time ago where an idiot (literally, mentally retarded) had a transceiver down near Roanok Virginia, and started talking to landing planes. At first it was real obvious he was not ATC, but after a while he got better and better at it. I forget how long, but it ages for anyone to actually track him down and catch him. Naturally the stupid media played it up so much I bet there were some copycats born.

So yes, of course such security by obscurity is not very effective. People with scanners and a bit of knowledge can identify such a frequency quickly. But it does make it just a bit harder for those people who do want to cause trouble, especially the stupid ones. If I saw a non-pilot with a scanner who was asking what the local ATC frequencies were I would tell him; if I say him with a transceiver I would be a bit reluctant to. And don't ask me why I think a pilot is safe, that's a silly assumption also. There are some malicious people out there who would think it would be a great joke to see if they could yell "Nxxxxx immediate right turn" or "Go around" and see if it worked. Heck, I met a commuter captain once who thought it was great fun to get up about 20,000', dial in Unicom, and say "Cessna on final go around before you hit him" and wonder how many airports he was heard at; heck most busier GA airports on a nice day have a cessna on final.

When you stop to think about it, with electronics so cheap, it's amazing air traffic control is less hassled by pranksters. So while the may be naive to think it prevents problems, I say more power to them for keeping quiet about frequencies and procedures.

In the thread, Pro43 the truth, I said that I had modified a unit with the 3A4 date and restored the cellular range. I really thought I had done that. But last night when I installed a new set of batteries I saw my unit was really a 1A4. I had forgotten that when I bought mine, I was looking for a 3A4 or earlier and after going through every one at my local store I had found a 1A4 model in among the 3A4s. I apologize to those I inadvertently mislead. It would seem the A at the end of the FCC-ID is the most definitive answer. To recap, my 43 with the Radio Shack name, with no A at the end of the FCC ID and No A in the serial number, and a 1A4 date was modifiable.

They are afraid of someone transmitting on that frequency at some
critical moment. Refusing to give out the frequency:

1) Keeps it out of the hands of those too dumb to scan for it.

2) relieves them of possible liability charges if someone does
transmit illegally.

I have a pro 43 and a general purpose ant.mounted on my roof.The frequencies I listen in on (154-162)get a lot of interference(Iwas told from paging).Grove offers a notch filter#FTR5(p.35)that says it will reduce or eliminate this kind of interference.my questions are:

1)Do these filters work?can I still pick up the marine traffic while using this filter?

2)Does anyone have any experience with Groves"SP-200 sound enhancer"?

Thanks for any insight or opinions,please e-mail me or post.

NCS.

I've got one (and a PRO-43)... It did not do the job I hoped for...
Essentially, the pagers are simply too strong from such a filter...

Did you ever stop to think that maybe the airshow staff may not know the
radio frequencies! I agree tower should know, but a quick look into the
flight supplements will give you the radio frqs. of the airport, the show
will quite often use one of those. It will probably be faster to scan...
As the users usally don't know (or care!!!) At our local airshow I asked
what comm frqs. (non-air) were being used (I'm a member of the Air Show
Association) Nobody knew as the radios were business band equipment that
was supplied for the event. The Motorola reps would know, but as far as
the show was concerned you just used the colour coded sets for your area
red for ops, blue for security, etc...

check 6,

Ok, here is my story. Pro-43, 12A3, model 20-300, FCC AA020-300,
sn low 70'2 no A prefix.

Did the mod. Moved d4 to d3. Opened up all 800, no more 30-54,
now have 68-88. Tried removing d3 altogether, still 800 but
nothing between 30-88. First valid freq at 118. Seems like the
choice is 800 and 68-88 (is there anything worthwhile here?)
or no 800 and 30-54. An interesting note, I stored a few freqs
in the 40s, and can direct up or down, but as soon as the loop
is made (ie 999) back to 118. And I suspect that the reading is
false because even though it appears to scan across 88->30 nothing
is picked up (for instance my hand held phone).

Of course I will immediately change it back to original spec since
I can't live without 30-54.

Mike

Not surprising. The frequencies are spaced to prevent interference from adjacent transmitters. All the above freqs are valid but not all in the same place.

Rob probably should have said "you will hear them on one or more of the following frequencys"

1606. Radio Shack New Product Line - Questions

Newsgroup: rec.radio.scanner
Date: 1994-09-03 22:40:54 UTC
From: g9153402@huey.csun.edu
Message-ID: <34au1m$ibl@nic-nac.CSU.net>
Source record: 269420

Got questions if any of the following is now modifiable:

I'm looking at the new, 1995 Radio Shack catalog. Page 30 shows their 800 mhz home scanners. They now have five models, with four being new. Are any of them modifiable? Has anyone found out the procedure to modify them, or are they totally unmodifiable unless one is a rocket scientist? The scanners pictured are:

PRO-2035 $449.99 It looks like their best scanner ever made, with 1000 channels, and a whole bunch of other goodies. I would buy one, if I won the lottery. Looks great, but since it's new for 1995, does that mean it's unmodifiable?

PRO-2036 $319.99 Nice unit too, but is it modifiable?

PRO-2037 $299.99 Nice unit too, but is it modifiable?

PRO-2039 $229.99 Nice unit too, but is it modifiable?

PRO-2030 $199.99 This is the only unit being sold that also was sold last year. I own one of these, and did modify it by cutting a diode, and it now does scan in the previously unusuable 800 mhz band, in the proper 30 khz spacing. But do the newer units still posess this capability, or are these now unmodifiable? When was the cut-off date? How do you tell an unmodifiable unit from a modifiable one without having to open up the unit?

Any info appreciated...

1607. Radio Shack - PRO-2030

Newsgroup: rec.radio.scanner

Source record: 269421

**
BC> Any mods known for the Radio Shack Pro-2030? Keyboard preferred, but
BC> hardware mod OK too, if that is all there is. Please post or e-mail.
BC> Thanks.

Product: Realistic PRO-2030 by Radio Shack
Purpose: Restore full 800 Mhz coverage

** Disclaimer...Modification of receiver will void the warranty of your unit. All modifications are done at your own risk.

** Monitoring of certain portions of the 800 Mhz band is prohibited by United States law.

** READ THIS!! IMPORTANT!! DO NOT PROCEED UNTIL YOU HAVE READ THIS!!**

New versions of the '2030 have been coming on the market that do not have L201. This is to comply with Federal US law. The jury is still out on whether the mod can still be performed even though L201 is no longer installed.

Modification of PRO-2030 for full 800 Mhz coverage with 30 khz stepping available. (Valid for models manufactured before May, 1994.)

1. Take out the screws at the bottom to open the 2030.
2. Look down into the top of the unit, behind the front panel, and locate a metal loop labeled L201.
3. Clip that part and move the two pieces slightly away from each other.
4. Re-assemble unit.

If your unit ever needs service, you can bend the two pieces back together and no one would know that the part had ever been snipped, due to it's rigidity.

1608. Lousy outdoor antenna or good indoor antenna?

"First Contact" is a newly forming publication. An electronically distributed email newsletter via the Internet for the beginner. Here is a forum to get the information you're craving. Get involved in this fascinating hobby! Scanning, ham radio, shortwave listening, CB radio, General Mobile Radio System (GMRS), etc. will all be covered.

You input is essential to the success of this publication. I need to know what you want to know and what subjects you want covered in the newsletter. I will attempt to publish on a monthly basis, possible bi-weekly if there is enough interest.

The only "cost" on your part is to fill out the following subscription form completely. A classified section is being contemplated with a small fee to advertise. Hard copies will be available to those without email access. Please contact me for details.

Everyone is welcomed to subscribe whether you've never turn on a radio or whether you're an old-timer. I am looking for authors to contribute short articles on the subjects you request.

So let's get "First Contact" off to a good start! Get your radio information via email. Subscribe NOW!

Please email this and any correspondence to rbellville@aol.com or:

Rob Bellville, N1NTE
PO Box 515
Millbury, MA 01527-0515
Thanks!

In response to Dave Ratcliffe's posting on 9/3/94:

Oh Dave, we just don't see a need for two groups discussing the same issues. We're not attempting to re-write the rules here...

For the heck of it, I checked the number of postings to alt.radio scanner yesterday. Where there were 8 postings to alt.radio.scanner, there were 34 postings to rec.radio scanner- obviously, rec.radio.scanner has twice or more postings to it on any given day anyway... Alot of us feel it's the cross-postings that have turned us off. Paul Cordingley was trying to come up with a reasonable use for alt.radio.scanner but I guess I've said it before and am in agreeance with another- "there's nothing we could post on alt.radio.scanner that we couldn't post on rec.radio.scanner...".

See you on rec.radio.scanner,

Shawn4SK1

> one hear both sides of the argument?

I'm confused. Could someone explain what the above means? On my scanner,
where I live, 824-849 mhz is quite dead. Nothing there. But on 869-896
there are loads of 'two-way' conversations, although one side is often
harder to hear then the other. Also, anything listened here, I often
will not here the entire conversation, as the systems change frequencies
and/or cell sites often.

Searching 46 mhz - 49 mhz you should find some, if you're in a populated
area. A particularly busy frequency in my area is 46.63 mhz. Some
local store must of had some sale on this model that uses this
frequency, so I see it used a lot.
If you live out in the boondocks, though, you may find nothing.
Also, in the 49 mhz range are some of those 'baby monitors', where a
parent can hear the baby in another room. You may also hear the
family arguing as the baby cries.
But, anyway, some jurisdictions have laws about monitoring cordless
phones. Also, some newer cordless phones broadcast somewhere in the
900 mhz range, and some scramble the conversations.

1614. Re: Lousy outdoor antenna or good indoor antenna?

Newsgroup: rec.radio.scanner
Date: 1994-09-04 01:39:25 UTC
From: bobscott@access1.digex.net
Message-ID: <34b8gd$rok@access1.digex.net>

Tough call without knowledge of your particular circumstances, but generally an outside antenna is best. Signal strength will be higher and it will probably be isolated from RF noise sources in your apartment (computer, baby monitor :-), etc.). Use good quality coax that is rated for the highest frequency you'll listen to. This usually rules out RG-58 ("CB" coax). Use 75 ohm RG-59 (cable TV coax) if you can't fit RG-8 through the window or whatever. Don't get into a lather over the impedance vs 53 ohm RG-8. The broad frequency range of the scanner, and its sensitivity make a 20 ohm mismatch pretty meaningless.

On the other hand, if your next door neighbor is arc-welding on his balcony every evening, stick with the mag-mount on the fridge.

Cheers,
Bob

Two items to note:
Removing diode D2 will disable the 30-54 MHz range. It's possible that this diode (or the trace leading to it) was damaged during the installation of diode D3.
If the 6-wire connector between the top and bottom boards is not aligned correctly during re-assembly, you can lose the enable signal to the front end for the 30-88 MHz section.

From the description, I'd say D2 was partially unsoldered.

I guess you can try Radio Shack's all-band ground plane antenna on
your terrace ($29.99 20-014). The thing is six feet tall, but narrow,
and a couple people in this newsgroup have had good success with it.
I, myself, just use RS magnetic mount antenna ($29.99 20-012) mounted
on top of a metal bookcase by a window which has a good clear view of
the outside. It works fine for me, as I get 1000s of frequencies. This
may be because I live in the San Fernando Valley/Northridge area of
Los Angeles, and the area is full of radio transmissions. But I suggest
experimenting...

I don't think so. there was a minor stink a few years ago I think
when the FAA downrated some transmitters. The twoer no longer has the
wattage to drown out erroneous transmissions.

>
>I know it's illegal to monitor cellular but is it illegal to monitor
>cordless phones? I see all the scanners that can monitor cellulars being
>wiped out but I've heard nothing about cordless...

The Electronic Communications Privacy Act of 1986 (ECPA) outlawed
the monitoring of cellphones, all pagers except tone-only, and
"any radio conversation that ends in a normal telephone connection"
(or some other equal description). Cordless phones were specifically
EXEMPTED from the ECPA, so on the Federal level they are AOK to
listen to. However, you'll want to check the laws in your state;
the ECPA didn't say that it was LEGAL to do so, just that the
ECPA didn't apply. So there could be a state law covering it.

I, however, have never heard of one.

When you think about it, it's ludicrous. Cell phone converstations
can be picked up 20 or so miles away from the caller, change frequencies
every so often (as they go to a new cell site), and are very hard to
track. It's also almost impossible to monitor a PARTICULAR cell-phone.

However, to monitor a particular CORDLESS is no trick. Any scanner
can scan the *10* cordless channels (on 46Mhz units) in less than a
second. So even if the phone is channel-changeable (not all are),
finding where they went is no trick at all. Plus, since they
are limited to 700' or so from the base, it's not like there's a
chance they will be hard to find. So tell me, which system needs
eavesdropping protection? Apparantly, Congress bought the cell
industry's notion that cell service did. (I'm sure some donations
helped THAT idea, eh?) Another bad law passed by a technically
brain-dead Congress.

It didn't seem to make any difference. They still have far superior
antennas. For every airport that I have ever flown into, I could hear
the tower much more clearly than any of the aircraft in the traffic
pattern. On the occasions where someone had an accidentally keyed
mike - I could hear the tower, but not other aircraft, through the
heterodyne.

If the pagers do not overload your scanner, with the antenna disconnected,
then you should be able to purchase or make a notch filter that would be
sufficient.

Nope, RS just don't make/badge a 25 - 1300 continuous coverage receiver. Why should they ? The vast majority of their market is within the US and the US laws are apparently sticky, and getting stickier by the day, about continuous coverage receivers.

I can't decide if the ridiculous US restrictions are good or bad news for the rest of us. On the one hand, there will be large inventories which will have to be dumped which is good news, but on the other hand there will be a smaller market for full coverage receivers which is bad news. Time will tell.

Mind you, the US situation is a lot more logical than the UK one. In the UK, intentional listening to the vast majority of frequencies is illegal, but the buying and selling of equipment to do so isn't. What you don't find much of in the UK is frequency lists, which are regarded as encouraging illegal activity. Even this is beginning to slip and there's at least two full listing books.

Just occasionally the authorities, in the form of the plod, get totally pissed off and get a bit heavy, resulting in such things as the famous alien landing sting. That appears to have gone into scanner mythology, but I'd be surprised if it didn't work again.

Ian.

The following frequencies are in use at the landings for the ferry in Galveston and Pt. Bolivar, Texas:

Galveston side: 460.225 simplex, handhelds used by the Galveston PD directing traffic, keeping people in line, and writing tickets for 'bunnies' (people who jump from one line to another). It is a hot, long wait at times and interesting monitoring when tempers flare.

Pt. Bolivar side: 154.950 simplex, handhelds used by Galveston County deputies for the same thing.

The ferry itself may be monitored on VHF Marine channel 13.

Unfortunately, overload is exactly my problem... With no antenna, I can pick up these pagers within about 5 miles of their tower site. While the Grove filter does reduce that range, it also acts as an attenuator for the rest of the bands...

The other thing which is not apparent from looking at the catalog is the size of the FTR-5... the thing is huge... a good six inches long with a one inch diameter.

OK, several people have written to say that they did the mod, and retained 30-54. But none of them moved d4 to d3, they just removed d4. What I suspect is that I damaged d2 while removing d4 the first time :-\. Oh well, I'll order another diode and report back when it is installed.

AD> simulation scenario I was developing and they refused to give it out
AD> (like anyone couldn't drive over there w/a GPS unit in-hand).

Seems *very* strange that a tower would try to keep their latitude and
longitude secret; makes for some very tough flight planning!

In any case, the Airport/Facility Directory, published every 8 weeks by the
Department of Commerce (NOAA), lists the precise latitude and longitude of
nearly all airports (private and public) in the country. It is issued in 7
volumes: Northeast, Southeast, South Central, North Central, Southwest, and
Northwest. Much easier and more accurate than driving over with a GPS! :-)

The book should be available from any outlet that sells aeronautical charts.

It is not currently a *federal* crime to monitor cordless
(but that may change with the new FBI wiretap bill), but some
states such as California has made it a crime for some time now.

The first offense is a $500 infraction and goes up exponentially
from there. :-)

I have been using the $22 Charger/conditioner and have had similar results
above. I avoided the AA 3 hours quick charge/conditioner based on the sole
reason that unless you use AA Ni-cads designed for fast charges (<5 hours)
you will shorten the battery life and capacity dramatically. The standard
Ni-cads on the market (6-14 hours charge time) are not designed to chemically
re-combine the oxygen generated during the quick-charge process. There are
manufacturers that sell 1 hour charge batteries and those would work fine.

The RS Ni-cads, even their high capacity batteries, are not made for 1-2 hour charges (regardless of what the RS employee tells you).

The 7 hour charger/conditioner is highly recommended. You manaully discharge the batteries using a switch. This is fine, since the circuit brings the batteries down to about .5 - .6 volts/cell, and this is where the batteries come as close as possible to factory formed levels. The only drawback is the charger doesn't switch off after the 7-8 hours recommended. No problem, if you exceed this for a few hours no harm done, but do not get into the habit of doing this. I use a timer that I set for 7 hours. This guarantees no over-charge. Warm (not hot) batteries are fine, as long as there is no venting of electrolyte (odors). If this happens, some battery capacity has been lost but is still usable.

Hope this helps. Overall, 5 - 7 hour chargers will work w/all the nicads on the market. Anything less than 5 hours should be used w/batteries meant specifically for this application.

The handset put out a max 3 watts and have very limited range unless you live hilltop like I do and use a multiband scanner antenna. Even so only a few miles is possible. This is the reason for the cellular multitower overlapping approach to assure you're always in range (usually).

Would anyone know of a resource where I can find information on constructing a miniature receiver which would probably have to use crystals to receive transmissions in the 460 Mhz range? Ideally I would construct this into a walkman or make my own case. The idea is that it should be small and portable and need only receive 1 frequency at a time.

Any help much appreciated.

40 channel CB needed soon! It should be able to scan all 40 channels, stopping on any busy channel for as long as the channel is busy, then continue scanning. I would like a used one or to buy a new one by mail order.

It's for my house-mate, Lee. He needs it for his work. He is a fork-lift driver and he recently got a job where some of the other workers are jealous of his good job. They are sabatoging some things around the saw mill when nobody is looking. They do this to make him look bad and it's coordinated on the CB channels. So we want to hook up a scanning CB to a VOX tape recorder and we will also set up a hidden camera if we can. We only need the regular 40 channels, it needs to scan all 40 channels and stop when it hears a signal.

It's important that we get this thing soon as Lee's job is in jeapardy. If you have a CB for sale or can recomend a mail order source please contact me ASAP!

Thanks.

Wrong... It's the F.B.I.

National Crime Information Computer..

Up here in Canada we have CPIC run by the R.C.M.P.

Canadian Police Information Computer, we often will run NCIC checks
on vehicles with USA licence plates. Our City police force has MDT
(Mobile Data Terminals) in every car, but NCIC checks have to be
run through a limited access modem connection to the FBI. Hope this
clears some things up.

Berton...
The cellular phones power is very low. So a cellular user would have to be practically in your driveway to receive the signal (Actually, I think it's a couple of miles.) in the 824-849 range. What you are hearing in the 869-894 range is the landline side and occasionally, the cellular phone user. I believe someone said that it depends on how far the user is from the tower that determines the volume of the transmission on the cellular end.

Jerry

I think that I am pretty safe in saying that there is no such animal. I
don't now know of any CB transceiver that "scans" the channels. You might
want to get a Radio Shack Pro-2006. I think that that scanner scans the
CB channels.

Cheers

How in the heck is such a law enforced? It has been well discussed in this newsgroup about cellular listening, but even the cheapest of scanners do 46 - 50 Mhz! Are the scanner police going to send everyone to scanner prison who search through 46 mhz when their search stops on a cordless telephone call? ...Totally unenforceable...

1661. Need portable scanner for RRs

Newsgroup: rec.radio.scanner
Date: 1994-09-04 23:42:45 UTC
From: pmb@netcom.com
Message-ID: <pmbCvMpvA.1rD@netcom.com>
Source record: 269475

Hi all.

I am a railroad and transit enthusiast and I would like to buy a scanner. Years ago, I had one and then lost it on a business trip. -(: I'm totally confused
by the models out these days, and I am honestly not a scanner enthusiast. However, I would like to get a unit with good "features" and sensitivity, etc. [hope I'm not misusing the terms.]

Please advise on on a brand/model which meets these needs. Also, if you have a unit for sale, please email me privately. And, pleae suggest a good mail order dealer. I have this genetic aversion to paying list price so some guy can have a fancy story in an upscale mall.

* Portable-size unit. The kind you can wear on your belt, with some kind of clip or attachment. I chase railroads and subway systems "in the field" usually while I'm walking around, and usually with a camera bag.
* "Good" sensitivity with a Rubber Ducky attenna.
* Covers the 160 MHz band, and other bands with railroad usage, as well as other commonly used bands. I am not particularly interested in listening in on cellular conversations or cordless phone conversations.
* Lots of channels so I don't need to reprogram the unit constantly.
* Good battery life. (optional) uses off-the-shelf batteries, not custom batteries.
* Alphanumeric display. (optional) place for comments that could be stored in a table, e.g. "Southern Pacific dispatch Roseville".
* (optional) RS232 port, so I can backup my stored channel settings. And, use my PC to create channel settings, rather than having to do this by punching buttons on the unit. Does this exist???

I'd also like some advice on a "car kit" and a "home kit". Different attenna for better sensitivity and running off 12V battery or AC power.

Also, please tell me about carrying cases that don't make me look too much like a police officer. No offence intended here, but sometimes trains are found in not-so-nice places, and I don't want anyone mistaking me (somewith who needs glassses bad!) for a police officer.

In advance, thanks for help.

Dirk of PA says:
" I don't know of any that you can get through mail order, however,
" there is a CD shop down here near where I live and they have a REAL NICE
" portable scanning CB radio with a headset, Vox, Extra channels and the
" whole 9 yards. Please note, however, that this unit is for professionals
oh, really... on CB... I think not! ^^^^^^^^^^^^
" (Not like the 49Mhz units found at radio shck for 69.00). Although the
" radios aren't EXTREMELY expensive, they are over $100 in price.

" Note again, that these have PRIVATE channels pre-installed so
" that you can switch to private frequencies (with handhelds of the same
" make supporting the extra channels).

They may have a "private line" type ctcss squelch available but certainly no
PRIVATE FREQS. At least not if they are unaltered consumer products.
Keep in mind, Dirk, that CB has to operate on allocated frequencies and
none of those are "PRIVATE"...

Has anyone else had problems dealing with the F.C.C. since they had to scale down their operation?

For the past 3 months I've been trying to get the forms for the renewal of our Public Safety Radio Licenses (form 574L). I keep getting their voice mail loop and never get a response either by phone or mail...

What gives???

Oh wait, I get it... all the field engineers and office help, armed with information from this newsgroup, are over at the Radio Shack stores boxing up all the cellular restorable scanners.

Yeah, That must be it.

HEY F.C.C. shut down the DAMN voice mail and answer the phone.
Or, at least respond to the requests for forms!!!!!!

There... I feel much better now!

Has anyone had any experience, good or bad with this scanner? I picked one up at a Hamfest and have not had good experience with it. I have to pick up the manual every time I do anything with it. (I know, DUH.)

I just got a RS 2006 at the local, friendly Radio Shack, and am in love with this unit. I accidently snipped a couple of diodes by accident and lo and behold the cellular freqs. are unblocked, accidently of course as it is illegal to listen to these frequencies. I will have to resolder the connections asap.

Now I need to toss the Radio Shk. discone and get something better. Any suggestions will be appreciated....

1666. List of Stores that carry scanners/products

In the documentary books "Spycatchers" (still banned in the UK,
I believe), you can send a truck around and catch receivers
tuned *to a particular frequency* by listening for particular
IF products.

One variation involved xmitting a carrier through a set of
frequencies and listening for the sum and difference products
of the first IF, sort of like how certain anti-theft tags work.

What a coincidence! I had the same sort of accident too, on another Radio Shack scanner. I had this seizure, in which I accidentally dropped a valuable diamond that fell into my scanner. I got a screwdriver, and opened it up. And behold, the diamond was wedged under a wire going to this certain diode. I had to get a pair of wire cutters to snip the wire, to get my diamond out. And then closed up my scanner and turned it back on. It then started to scan the entire 800 mhz range. Absolutely amazing, and I owe it to butterfingers-me, for dropping jewelery into my scanner. ... You got to understand. This just could happen to anyone, you know...

mshafer@herbie.unl.edu

My local Radio Shack has one Pro-43 left. The serial number has no A after the 300 and its date code shows production before the change-over. Before I purchase it, I wanted to find out the process for ordering one from a Radio Shack in Canada. Does anyone have actual experience with this procedure? If I ordered one from Canada, would it have a broader range of freqs? Would there be no gaps in the scanning ability of the unit? Would any mods be needed and if so would they be the same mods I have for the U.S. version of the Pro-43? Do you have an exact dealer you have done business with, with his phone number and cost for unit plus shipping?
Thanks for any and all info.

1686. Latest GROVE Catalog!

Newsgroup: rec.radio.scanner

From: steven@sgb.oau.org
Message-ID: <Cvnvwz.4sF@sgb.oau.org>
Source record: 269499

It is rare in these modern times I can write *anything* good about Grove Enterprises, but with the recently received Grove catalog (Sept-Oct 94), it seems I must make an exception.

Let's start with the front page -- cover page. I spy an IC-R7100 Window Scanning System ICOM receiver. Significant is that these now must be imported from overseas sources unless you can get a corrupt official to "make" you an "official looking" purchase order.

Is that a -1 or -2 unit in the photo?

All packages are now sent 2nd day air for the price of ground. That is *nice*.

Page 3:

Data line / Fax service 24 hours/day 7 days/week: (704) 837-2216
Now that *is* an improvement! A 24 hour modem line, nice work Bob!

A quote from his opening comments:

It seems as if the well of cellular-capable and cellular-restorable scanners has finally dried up. We are down to our last few PRO-2006s, the only remaining cellular-restorable scanner in the catalog. And that will be it.

The Federal Communications Commission (FCC) is now looking with suspicion at several new scanner models which have been certified, but which can receive cellular phone calls by pressing a factory-test keyboard routine. The scanners may be prohibited from sale and their certification revoked.

So how are these different from the cellular telephones which can also become cellular scanners by a simply keyboard routine? If the FCC bans the scanners, they should be banning the phones as well. I'm sure this would bring a painful cry from the very industry that purchased your Congress's ban on scanners.

--
Well, my hat is off to you Bob! You have *finally* come to your senses! Here is a general question for anyone who may have answer(s):

Since a "rider" on the FCC budget is what started this fiasco, is it possible to force a rider on another budget requiring full range scanning receivers be accepted again, ie reversing the present law they forced into existance? I mean if there is another add-on requiring the change, they would be forced to do so, only I'd rather it not take two YEARS to implement it!

If so, we need to write/speak to our congress-critters daily, weekly, monthly and let them know we want this changed -- and have it tagged onto another budget approval like the ban was sneaked in as. I feel we have a chance to do this *if* we also bring out the fact that cellular phones need to be banned if

they do not, and pressure the issue so hard they would be forced to take one direction or the other (either ban the phones, or remove the scanning restrictions!) With a little industry support, we could actually do this! Do not think for one moment that Radio Shack will be making a profit from those units returned for re-work! This may interest them to do something about it!

Next item - under LIMITED WARRANTY:

Grove Enterprices assumes no responsibility for damages or penalties incurred resulting from the use of this product in a manner or location other than that for which it was intended.
--
Well, that statement there says "we can sell you international non-FCC approved equipment under condition you sign a statement that your purchase is for use outside of the U.S." Correct? I hope this gives someone some ideas?

Of course, there are those who say "never assume anything"... :(

Page 4:

The Watkins-Johnson HF1000 luxury receiver and AOR 3030 general coverage receivers are illustrated. Taking note at the top of the page:
"FULL COVERAGE RECEIVERS"

Not exactly "full coverage" really, Bob? Perhaps full coverage shortwave receivers may have been better stated!

I also note putting them side by side was a nice approach to the sales line: "Professional quality at a low consumer price!" with only $3000 difference, nice advertising touch! I guess that means you stock one HF1000 to every five hundred AOR3030s.

I detect the omission of all KENWOOD shortwave receivers and accessories as well (sob) I guess that means Universal is my "universal source" for such accessories for my R-5000. Oh well...

Side comment as I plow into the scanning department - why hasn't anyone made a tunable receiver (like the old VHF-hi/lo/UHF models of 15 years ago) with only 3 storage channels (for your favourites) to get around the TDDRA garbage that specifically tunes the cellular region? I am sure someone would figure a way to increase the memory capacity as an after-market item!

Page 12:

Moving right along -- we find the M400 Universal Decoder Version 2! I bought mine last year -- and STILL have version 1.04! I would have hoped to see the upgrade kit available by NOW!

Page 16:

ICOM R100 and R1 (page 17) clearly state 100khz-800 Mhz and 900-1300 Mhz! I guess that means no more cops on trunked systems if you are dumb enough to buy an ICOM!

SIGNIFICANT ITEM BOTTOM OF PAGE 17:

The new AR8000 scanner, $649.95. This model supposedly will have the cellular blocked via programming through the serial interface. This means it should be readily alterable by computer literate folks with PCs in the near future! So this one model may become the gold mine of the future for those wishing to buy cellular capable scanners. No news yet as to how to alter, just word on the street is it will be done via the serial port. So -- we await Grove to start selling the interface as well. I suspect you will need to import the program to do the cellular restore from Javiation or other overseas supplier when it becomes available -- but this is 100% legal with the fact FCC can NOT regulate SOFTWARE ON FLOPPY DISKS! Yippeeee!

Page 18:

The AR1500 supposedly will permit some infringement of the TDDRA rules if you want to listen to the mobile side of cellular, as it (supposedly) receives 500 khz-869 Mhz and 894 Mhz-1300 Mhz. Same with the AR3000A as well!

Page 20:

The Uniden 760XLT and 855XLT were both specifically noted as being restorable as per cellular.

Page 22:

The 2006 still was noted as restorable too!

Page 23:

The new nationwide FCC Database on CDROM with MAPPING is now listed at $169.95 or without mapping for $99.95.

Can someone who has the mapping option tell us how good it really is? How does it compare to some of the other CD-ROM mappers presently available in the $100 range? Can the mapping be used alone?

Page 28:

The OptoScan 456 interface is featured for $279.95, I wish they would make one for the newer "non-modifiable" R/S lineup! As I understand it, this kit will permit you to override cpu cellular blocks via computer and get around the FCC crap! It does many other things too!

Page 30:

Overpriced channel organizers. It would not have been so bad if they would have been computer printable and sold as a refill package, at costs from $13 to $16, ouch, too high Bob!

Page 35:

Nice GRE Super Converter advertisement, to obtain uninterrupted 810-912 mhz coverage! Nice job Bob, no comments about in short supply, hurry while supplies last, these too are under the TDDRA ban! It was a relief not to read the hype you have vented in the past six plus months! Perhaps this is a sign of change? Or that GRE has chosen to take a stand and ignore the TDDRA garbage!! I'm not sure, but I don't think they required FCC approval, and

certainly NOT as a scanning receiver!

Back Page:

R7000 Service Manual -- although I doubt it has the re-fit instructions to restore the 800-900 mhz band!

Overall, I'd give the latest Grove catalog, four (out of) five stars! He appears to have actually made an effort to return to the responsible (to the scanner enthusiasts) dealer he once was! The catalog was informative and useful. One nice touch though would be upgrade kits for the Pro-43 to convert them to international models. Check Tandy UK service for the costs of the digital board, add in a reasonable percentage to cover costs and make some profit, and then import and sell these circuit boards! The FCC can not touch them (they are not a converter NOR a scanning receiver of four or more channels!) I am sure the same market who is looking at the Opto456 would be as interested in an international digital board (the one with the CPU and diodes on it) for the Pro-43s!

Nice job Bob!

For those of you in ohio, you will find that the check on that scanner under your dash, will be done on R.C.I.C. or Regional Crinme Information Center which is run by the Bureau of Criminal Investigation, State of Ohio.

This database runs quicker for Public Safety officers and contains more detail information concerning crimes within the state. It is in this system where serial numbers exist of stolen property, criminal aliases, statistics and indepth history on each known criminal that has been known to resibde in the state.

I am sure each state has thier own in house system

1688. Pro43 diode spec needed

Newsgroup: rec.radio.scanner
Date: 1994-09-05 15:19:31 UTC
From: crumrine@crsgi1.erenj.com
Message-ID: <1994Sep5.151931.17212@erenj.com>
Source record: 269507

Hi,

I recently posted regarding modifying my pro43. I suspect that I damaged d2 while moving d4 to d3, since I no longer get freq 30-54. This has been confirmed thru email that others have not lost this range, I conclude that d2 is certainly trashed. Does anyone have the spec for this diode, so I may go to the local RS and get it? I am awaiting my service manual, but this is the kind of thing tht makes me itchy ;-).

Cross-posted to: rec.radio.scanner,alt.radio.scanner

I too was excited when I first noticed his latest ad for the new line of filters. However, if you read the text carefully, you will note that none of the filters claim to actually notch out the frequency bands where most pagers are located (near 151 and 158 MHz). Thus, although they claim these filters can "notch out pager interference" they won't.

The best thing I can suggest is to insert a 10 to 20 dB attenuator in line with your antenna in order to reduce the overall signal strength. This should greatly improve the pager interference problem (due to receiver front-end overload). The drawback to this, of course, is that the desired -signals- are reduced as well. If they are local, you may not notice too big a difference.

Why??? This is a camcorder inside a private home. And though it's pointed outside, it's aimed at a public street and driveways, parking places, etc., that are open to same... not in other people's windows. If people outside talk loudly enough for their nefarious plans to be overheard (and, incidentally, recorded), it's their lookout, especially since there are signs posted warning of the practice.

Message-ID: <34fpbn$ph7@crl7.crl.com>
Source record: 269509

I have a number of questions about the OS456 that I would like answered before I purchase. (Sure, why not....)

The ads say that there is no soldering and no drilling of holes. Okay, so how is it interfaced? Also, if this is added to my 2006, will I still be able to use the scanner in its regular, non OS456, manner? And is it possible to load/unload frequencies from the scanner to computer, etc.

How big is the device? I see pictures of it next to a 2006 with the top of the case open, but I do not see the front of the OS456. Does it look like: a DC440? a modem? a TNC? a cigar box?

Also in the ads I note that the display on the 2006 is blank. Is this because it is no longer used, as the computer's monitor is now the default? (This refers to an above paragraph: can I use the 2006 in its 'regular' manner.)

I've heard a lot of good about this add-on, and between the sales-pitch and user-reviews I'm inclined to CIO (i.e. purchase), but: questions, questions, questions....

TNX & 73 for the response.

>I have a number of questions about the OS456 that I would like answered
>before I purchase. (Sure, why not....)<

James,
The OptoScan 456 looks more like a PC expansion card than a anything else. It has 6 ribbon cable connectors (3 from the radio and 3 to the radio). They snap in, so there isn't any soldering.

The battery compartment is removed and a new face plate takes it place. The plate has an RS-232 9 Pin connector, an Icom compatible CI-V mini jack port, and a Tape Pause jack. The 9volt back up battery is double-stick taped to the inside of the radio. There's nothing that hangs outside the radio, except the connectors above. It's a very clean addition to the radio.

You cannot upload and download to and from the radio's memory. You can use your radio the same way you do without an OptoScan456, when it's not under computer conrtrol. You'll probably loose your radio's memory during the installation though. When it's under computer control the radio's display is blanked.

I think that answers all of them. If not, let me know, and I'll try again.

I've got one, and love it. I can read CTCSS and DCS tones as well as DTMF digits. I write a shareware program called Radio Manager for Windows to control the Icom radios, and now the OptoScan 456. If you'd like more info please let me know.

Good Luck,

The PRO-43 service manual has the following descriptions for D1-D4:

Ref No. Diodes Mfr's Part No.
------- ------------------------------------ --------------
D1 MA110 marked 1A (silicon) MA110
or 1SS352 Marked C1 (silicon) or 1SS352
D2 MA110 marked 1A (silicon) MA110
or 1SS352 marked C1 (silicon) or 1SS352 D3
Not used
D1 MA110 marked 1A (silicon) MA110
or 1SS352 marked C1 (silicon) or 1SS352
DA1 MA121 marked M2D (silicon) MA121
DA2 MA121 marked M2D (silicon) MA121

I remember seeing somewhere modifcation instruction for the PRO 43
other than the cellular and speed-ups. If you have material
releating to the PRO-43 that you can pass on to me via e-mail, I
would appreciate it.

Thanks,

Regards,

David M. Comer

Message-ID: <34gb0h$7np@nic-nac.CSU.net>
Source record: 269275

Where do I call to get the latest Grove catalog? Does it cost anything?

Also, to continue on with the discussion of making a Motorola Cellphone (flip-phone type) into a scanner by grounding some connection in the battery compartment to put it into a test mode. Does this just make the cellphone into a cellular scanner by hearing the tower frequencies, or does it allow broadcasting on the handset frequency at the same time, allowing one to 'drop-into' an existing phone call? I don't know if this is possible, since the phone would have a different ESN, but it would do wonders to screw-up cellphone service.

But I sort of agree with another person's comments. Since the cellphone industry was semi-successful with cellular capable scanners, the FCC should also outlaw the cellphones themselves, since there are probably many ways in making many models into cellular scanners. This I wouldn't doubt, since cellphones are made dirt-cheap these days that they obviously don't have much security built in, and should be modifiable with anyone with the correct knowledge, and maybe a soldering iron...

What type of frequencies are you after? I have a file of about 100K worth of various frequencies I've monitored over the past few years. (Some are good, some aren't and some are unidentified). I would think posting the whole thing here would be a little too much. I'd be happy to e-mail it you (or anyone else that wants it) or I can post here just those frequencies you would be most interested in.

In article <34g6o1$2ji@search01.news.aol.com>, wwhitby@aol.com (Wwhitby) writes:

The filter you are refering to is (i think) the Grove FTR5

I spoke personally with Bob Grove several years ago and he informed me that
he was soon to be releasing a new filter the FTR5.

I can only say this. FANTASTIC.

I live in a heavily populated area full of nasty rf. Including a pager or two.

Well it was as though I had moved to the top of a hill and installed a tower with hardline.

I could hear the NWS freqs from 50 miles away where without the filter I could hear nothing at all.

And I mean 'FULL QUIETING' no static at all.

The only drawback that I have noticed is that the bandwidth of the broadcast filter rolls off a little slowly above 108mhz resulting in some of the air freqs being attenuated somewhat. It seems to be good above 115mhz though.

In summary ; Go for the GROVE FTR5. It is worth every penny and more !!

1715. Phone Security Device for sale

Newsgroup: rec.radio.scanner
Date: 1994-09-06 02:34:56 UTC
From: satfax@nbnet.nb.ca
Message-ID: <satfax.152.0@nbnet.nb.ca>
Source record: 269278

I have available a new product that I'm sure you can find some use for. Have you ever wished you had an unlisted phone number but you can't see fit to pay the phone company the high monthly rate to maintain your phone privacy (in my area it costs $ 4.75 per month). OK, lets say you do pay the phone company the monthly rate to have an unlisted phone number and one of your friends, who you gave your number to, lets someone have your number who normally doesn't have it so they can get in touch with you. Pretty soon a lot of people have your "unlisted" phone number and you are getting calls from people you do't really want to talk to. Well you can correct that by having you unlisted phone number changed to a new number for the fee of $ 17.50, the cost in my area. You can see how soon all these charges add up and you still don't have complete control over your phone.....UNTIL NOW...

Available now you can own the " TELE-SCREEN " telephone security device which does the following:

Someone tries to call you and before your phone will even ring the caller is greeted by the voice prompt " Thank you for calling. Please input four-digit pass-code for connection ". Your phone will only ring if the caller enters the correct 4 digit code. If the caller enters an incorrect pass-code they will again be given one more chance, by voice prompt, to enter the correct pass-code. Should they fail to enter the correct code on the second attempt they will be automatically disconn--ected and your phone will not even have rung once. Of course only your closest friends and family will have the required 4 digit pass-code.
Now let's say that a friend gives the pass-code to someone that you really don't want to have it - no problem, you just change the pass-code at any time (as many times as you want) via the key pad on the top of the unit. The LCD display on the unit shows the current pass-code setting. It also comes packed with it's own plug-in power supply and is as easy to install as an answering machine. The unit can also be deactivated at any time with the simple push of one button. This will also work to secure your modem or fax line as well. This unit is very portable and compact and can be taken with you anywhere you go as well.
Finally, without being dependant on your phone company, you will be able to take control of your phone.

Available for $ 89.95 plus $ 4.95 shipping (TOTAL $ 94.90) payable by Postal Money Order ONLY, all other forms of payment will be refused. All prices are in U.S. funds. E-mail me if you are interested. All orders will be shipped via U.S. Mail from Maine.

-> Does a device exist that converts the 460 Mhz to
-> the frequency used by FM stations?

Sure. Step 1) buy my old Bearcat 100 (pre-XLT, really old 16 channel scanner for, oh, say, $35. Step 2) get one of those close-out "Silent Play" adapters being closed-out by Radio Shack for about $15; Step 3) plug "silent Play" into earpnone jack of scanner, tune scanner to desired frequency, broadcast scanner audio to any FM radio within maybe 100 feet. Really good fidelity, too.

From: shawn4sk1@aol.com
Message-ID: <34gsl9$8r0@search01.news.aol.com>
Source record: 269283

Yes, it's 2006 mods, Part 9642-

I read tonight that a guy souped up his 2006 to where he had a 6400 channel memory bank! I don't know if that's a well know one but it looked kinda hard to me... besides, 6400 is great but too far fetched for my neck of the woods- we only have 3 primary Police channels!! And I would consider my city to be fairly large...

Anyway, I was wondering, besides cutting the 2 diodes for scan speed increase and cell freqs, and of course the one I mentioned above, what other fairly easy mods are there? Also, for kicks, what are some of the more ridiculous ones? I've heard a bit about the computer interface one but it surprised the heck outta me to see a mod for 6400 channel memory! This thing can do anything, huh?!

Also, I read in the Grove Ad (heard not to trust Grove very much) that if you modify the 2006 to pick up cell freqs, it'll also provide a 30 step option. Mine doesn't. Is that because I have the "A" version or did I not do the whole mod? And with steps, is there really any hard, fast rule as to which freqs are best set to which steps?

Last, my friend saw something about the 2006 I supposedly posted to alt.radio.scanner- very funny guys... It's not that I don't agree with it but anyone who's been reading rec.radio.scanner for awhile knows a)how I feel about alt.radi.scanner and b)that I've only had a 2006 for about 2 weeks... Nice try.

Thanks In Advance to ALL Who Provide Answers To My 'Hopefully Not Too Over-redundant' Questions! :-) :-) :-)

Message-ID: <34gvdo$q7u@news.ysu.edu>
Source record: 269284

I have been checking on a application for a public safety agency client
of mine that I submitted in June......I didn't connect with any voice
mail though I called Gettysburgh and it took approximately 12 minutes
to get through to a data clerk......What was nice to an age old problem
of just hanging on the phone is that every few minutes a digital voice
announced that I was the 5th in line, 4th in line, 3rd in line and so on.
At least I had an idea where I "stood" in line.

Once I got the clerk, I asked for the file number so I wouldn't have to
call back time and time again.
It is alot cheaper to track the progress via Interactive Systems, Inc.
on line FCC Database since they are the ONLY outside vendor of govt.
info that recieves data NIGHTLY.

BTW, she said that licensing was going about 84 days after receiving
the app from APCO.

In a renewal situation such as yours....wait NO MORE than three months
before expiration date and submit a modification by a simple mobile unit
increase. We all can use more radios. <grin>

>>interface over the J-Com interface cables ?? Does the Icom
>>pass the S-meter signal or anything else that the J-Com
>>will ignore ?

>I also understand that the R7000 and R71A do not support the s-meter
>being read via the port. SO it is really a matter of the receiver
>multiplexing the s-meter onto the signal wire rather than the
>level converter offering or not offering S-meter support.

If you want to read any data over the interface, the radio must support
an explicit command for setting/ reading that particular piece of data.

If you want to read the squelch status, it is only supported on the
R9000, R72 and R7100 (according to the Icom CI-V Reference Manual
available for about $20.)

Reading the signal strength is allowed on the R9000 and the R7100.

The command number for Squelch is [0x15] [0x01]
The command number for signal strength is [0x15] [0x02]

As an example, the following would request squelch data:
if the controller has id of 0xe0, and the radio has id of 0x1e

[0xfe][0xfe][0x1e][0xe0][0x15][0x01][0xfd]

The radio should respond with
[0xfe][0xfe][0xe0][0x1e][[0x15][0x01][VVV][0xfd]

VVV is a single byte with the following two values:
0x00 == squelch is closed
0x01 == squelch is open

Keep in mind that the icom multidrop protocol is a *Single* data wire use
to both transmit and receiver over a CSMA ttl open-collector 'ethernet'
like interface (usually defaults to 1200 baud) so everything you transmit
will be echoed back to you in addition to everything anyone else on the
multidrop says.

Kind of cute way of doing any-to-any.

I have read in Bill Cheek's book about the 6400 channel mod.
It involves removing and replacing a RAM chip and adding a DIP switch.
He also has mods for LED S-meters, Centering meters, squelch tightening
Tape outputs and switching, faster speedups and more.

>Also, I read in the Grove Ad (heard not to trust Grove very much) that if

Should scan at 30KHz. Try pushing the ReSet button when in that range. It'll
default to NBFM at 30KHz spacing.

I have had mine for about 6 months and am real happy with it. the scan rate is phenominal. The only drawback I can find is in high RF areas. the front end is so sensitive that it overloads easily. However a 10db attenuator will fix that. It will pick up things on it;s rubber duckie that my Pro 2006 on a discone won't even here. If the price is right I would say go for it.

1728. Opto Scout reviews?

Newsgroup: rec.radio.scanner
Date: 1994-09-06 07:39:05 UTC
From: arnim@lenti.med.umn.edu
Message-ID: <Cvp6uJ.116@news.cis.umn.edu>
Source record: 269289

Has anyone tried the new Optoelectronics Scout 25? I've seen it advertised in Monitoring Times for a few months, sounds really cool!. According to the add it will "automatically find and record frequencies". Has a 50 freq memory for autostorage and a hit counter for each freq in memory. Also has a switchable audible alarm or a vibrator alarm when a new freq or one in memory is received.
I've got an old model 2210 that I bought about 3 years ago, full of dreams of "tralling" for freqs - just driving down the street and writing down all the new finds. Well of course that doesn't work too good because of all the continous psuedo-random display of everything it receives. The only way to actually "capture" a freq is to be continuously watching the display and look for the same freq shown twice in succesive displays. Pretty useless for semi-covert monitoring. I assume that this problem has been taken care of with this new unit.
Please let me know:
1) scan accuracy and false alarm problems.
2) approx range for differant wavelengths.
Also has anybody seen any reviews for this in any of the radio-magazines?

thanks

.

>faith... I trust you" approach as long as there are people like you around.

>So, if you've got a better suggestion, I'm sure that everyone here, the industry
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
>association and the federal government would all like to hear it.

I have an idea Scott -

How about the industry investing in a *very* small amount of foresight?
The industry had the technology to build a system that was secure and
instead chose to use a transmission mechanism that anyone could LEGALLY
listen to. (all these laws were not in effect in 1979 when they started
building the infrastructure.)

The radio listening hobby predates even the notion of cellular
communications.

Because the industry decided to compromise the integrity of the system
they were building (EVEN THOUGH THEY WERE WARNED NOT TO) anyone anywhere
could monitor the simple FM transmissions.

The industry noticed this and decided to engineer a solution...NOT!
The 'solution' was to spend money to buy a set of laws, because buying
laws is cheaper than retrofitting the $20 billion cellular
infrastructure in the US that was continually built up even though the
problem and solutions were well understood.

The result is that freedoms are compromised.

If the phone company decided that they would design a system
today which transmitted private information by posting the information on
billboards, this rationale suggests that the correct solution would be to
pass a law regulating those who look at billboards.

Other countries are doing it right. (e.g. gsm, jdc, ...)

We have no excuse, and have set an improper precedent.

Mick

What if a family member is hurt in a car accident and is unable to
give the access code to the hosptial folks. How are they going to
contact you in an emergency?

What if you lost your wallet and when someone you don't know calls
to tell you and they don't get through because they don't know the access
code?

What if a company that has your resume from six months ago wants to
call and set-up an interview and they don't know the access code?

This sounds like an interesting device but I can see alot of problems
with it like the above. I wouldn't feel right about expecting everyone
else who calls me to remember a access code just to talk to me. What
if they forget the access code? How are they going to call up to
let you know? :-)

The problem is many video cameras have directional microphones. If you pick up conversations that would not have been audiable to the normal human ear, you may have trouble with that tape.

HAMFEST/COMPUTERFEST CALENDAR 1994 - NORTHERN ILLINOIS
last updated July 26, 1994 |

o Please report additions or changes to Bob Parnass, AJ9S, office phone: (708)979-5414, electronic mail: parnass@ihlpf.att.com.

SEPTEMBER *

September 11, Sunday: Joliet, IL - Bolingbrook ARS Ham/Computerfest, Inwood Recreation Center, 3000 W. Jefferson. This is a medium size hamfest with indoor/outdoor flea market. Gates open 8 AM for general public. Outdoor flea market on paved lot -- setup at 6 AM. Use Exit 253 from I55, or Exits 126/130 from I80. Admission $5. VE testing 9 AM - 12 noon. Bring original license and photocopy, ID and photo ID, plus $5.75 test fee. Novice-only tests are free. Talk-in 147.33, 224.54, and 443.525 MHz repeaters. Indoor table reservation, call Ed Weinstein at 708-085-0527. Info, BARS Hotline (708)759-7005 between 6 AM and 9 PM. |

September 11, Sunday: Chicago, IL - Vintage Audio Fair |
The Vintage Audio Fair, organized by the Chicago Vin- |
tage Audio Society will be held on 11 Sep 1994 at |
Irish-American Heritage Center, 4220 N. Knox, Chicago, |
IL (vicinity of I94-Edens Expwy and Wilson Ave). We |
expect about 30 exhibitors and 300-500 people attend- |
ing. Admission is $5.00, table - $75.00. For more info |
call: days: 312-545-2641, nights: 312-338-1042. Mail |
your inquiry to: 5308 W. Lawrence, Chicago, IL 60630. |
The show is for all MacInstosh - Marantz freaks, tube |
maniacs, audiophiles, musicians, aficionados and all |
alike!

September 17-18, Saturday & Sunday: Peoria, IL - Superfest. Admission $5. For more info call (309)685-6698. Talk in on 146.76 (-600 kHz offset).

September 24-25, Saturday & Sunday: Grayslake, IL - Chicago FM Club, Ham Radio Expo. This is a large hamfest with indoor and outdoor flea markets. Lake County Fairgrounds, Rts 45 & 120. 6AM - 6PM. Info 146.76 MHz (-600). Admission $6 at gate, one ticket good for 2 days. Kids under 12 free.

OCTOBER

October 23, Sunday: Waukesha, WI - Kettle Moraine Ham-
fest Sponsor: Kettle Moraine Radio Amateurs Waukesha
County Exposition Center Forum Building, Highways J and
FT All orders MUST be accompanied by a SASE and mailed
to: KMRA Swapfest, P.O. Box 411, Waukesha, WI
53187-0411 General Admission - $4.00 ($5.00 at the
door)

NOVEMBER 1994

November 19-20, Sat.-Sun.: Fort Wayne, IN - Fort Wayne
Hamfest Sponsor: Allen County Amateur Radio Technical
Society (ACARTS) Allen County War Memorial Coliseum
Exposition Center Admission: $5.00 (No advance ticket
sales.) For information or table orders, send a SASE
to: ACARTS, P. O. Box 10342, Fort Wayne, IN 46851 or
call John Rufner at 219-483-6305 (table info) Don Gag-
non at 219-484-3317 (general info)

Nov 27, Sunday: Wheaton, IL - GMRS of Illinois May Fest
'94. Admission $5. Starts 8 AM. Setup 6 AM. Info,
call (708)690-1492.

COMPUTERFEST SCHEDULE

September 17, Saturday: Kankakee, IL - Computer Fest
1994. Sponsor: Kankakee River Valley Computer Users'
Group. Kankakee County Fairgrounds 9:00 a.m. to 3:30
p.m. Admission $4.00. Information: 815-935-8590 or
815-935-1605>

Computer Central, College of DuPAGE, Main Arena of the
Physical Education Building Park Blvd & College Road,
Glen Ellyn, Il. 708-940-7547 $5 with card Normal
admission $6.00 Opens 9:30 am - 3:00 pm

05/22/94, 06/26/94, 07/31/94, 09/18/94, 10/30/94,
11/27/94

Orland Park Computer Show held at The Orland Park Civic
Center, 147th Street & LaGrange Road, Orland Park, Il.
9:30AM - 3:00PM. Call 708-974-3123 for information or
to get on mailing list. Admission $5.00 or $4.00 with
card.

I ended up at the same airport and purchased the Northeast version. BTW,
I've known of individuals walk up to the pilots of military aircraft and
ask them what frequencies (channel) they were using and the boys in uniform
were more than happy to let them know. Go figure.

From: domonkos@access.digex.net
Message-ID: <cr6RkiubGoDU066yn@access.digex.net>
Source record: 269299

What is the technical difference between the 800Mhz restorable Pro-43 and the non-restorable models (besides the cell-mod). Are the diodes only missing and is the chip that's used the same or have both been changed. If the chip is the same is it conceivable to mount a diode or go directly to the chip's pins for modifications? If the chip has been changed then all bets are off.

Monday, September 4. Radio Shack.. Princeton, NJ

Him: May I help you?
Me: Do you have your HTX-202's on sale?
H: We sure do [reaches for the demo and puts it on the counter]
M: Terrific. Do you take personal checks?
H: With a driver's license and a major credit card.
M: You do realize that's it's illegal to request a credit
card as backup to a personal check, don't you?
H: It's not my policy, sir, it's the company's.
M: That policy is illegal. Besides, I don't have one.
H: [Holds the *demo* behind his back] Then I can't sell
you the unit, sir.
M: Look, I'm a local. I have my license, the check is good.
H: *sigh* Fine, I'll do it. [walks over and gets a new one]
How long has it been illegal?
M: [caught off guard] ummm, about a year.
H: That's funny, we just started asking a year ago, and I never
heard about that.
M: It doesn't surprise me that big corporations wouldn't want
that to get out. They want to protect themselves at all angles.
H: You know, I just need to look at the expiration date. I
don't need the number or anything.
M: That's fine and dandy. I don't have a credit card.
[open the box, examine the contents, he sells me the service plan]
[I write out the check and write my license number down without
even looking since my license address is far away from the Princeton
address on my checks]
H: Do you have your license number memorized or something?
M: Yup.
H: Sheesh.

RE:

: Actually with satellites and using DTOA (Differential Time of Arrival)
: techniques a transmitter can be located quite precisely. It is just a matter
: of spending the bucks to do it. In cases of satellite jamming (a la
: Captain Midnight/HBO) it is worth the time and energy to do it.

Captain Midnight was caught because he bragged about his exploits. The FEDs would like to have you think it was a high tech investigation that exposed him but in reality it was his big mouth (low tech). Another urban legend (one that the FEDs like to repeat).

It's like the stories about how OJ was tracked down. Some media sources have implied that the cellular call was traced. Yeah, he was traced via a cellular phone - the one the folks used to call in on after seeing the Bronco.

We should be more concerned about that poor boy in England who needs (insert you favorite, business cards, get well cards, etc.) to help him make the Guiness (sp?) World record book... :)

>receiver front-end overload). The drawback to this, of course, is that
>the desired -signals- are reduced as well. If they are local, you may
>not notice too big a difference.
I live in Urban area that is a test for any scanner. I'm within the
line of site (five miles) from a massive TV tower carrying five
stations, plus FM stations and to the South of that I am looking at
several more TV stations antennas on a mountain. What I found is even
my YUPI suffered from strong overload until I purchased a AOR MPIF-1
filter. It's not cheap at $59.00 but IT WORKS! The YUPI is great radio
with it attached and a piece of junk without it. All the of cross-mod
and most of the pager interference disappeared.

1747. Bought a BC8500XLT...mistake?

Newsgroup: rec.radio.scanner
Date: 1994-09-06 14:36:28 UTC
From: nfrancis@indiana.edu
Message-ID: <nfrancis.28.00099BE3@indiana.edu>
Source record: 269306

I'm new to scanning. I recently bought an BC8500XLT for $350. I reasoned that it was Uniden's best scanner, and had the added benefit of an alphanumeric display (can program in a name for the freq display; e.g., Dallas Police).

1. Was this a mistake? Are there flaws in the design of this model? Is this model now discontinued?
2. The technical specs in the manual are lousy. Anyone have info such as receiver sensitivity, etc.?
3. I'm not particulary interested in cellular coverage, but...is there a way to modify this model for continuous 800 mhz coverage? I am picking up cellular in the 1268 - 1280 mhz range. These are images, right?
4. Without an alphanumeric display on scanners with 500 to 1,000 channels, how in the world does someone remember what all of those channels are assigned to?
5. I can't program an alphanumeric display to the channels above bank J (251 - 500). Am I doing something wrong, or is this a limitation? The manual doesn't say anything about this limitation, and the ad pictures for this model clearly show an alphnumeric display on channel 500.

Any help would be appreciated. Thanks.

Source record: 269307
Cross-posted to: rec.aviation.misc,rec.radio.scanner

Okay, thanks everyone. I just thought it was a little strange
that they didn't volunteer the frequency, but I hadn't thought of
the "stuck mike" scenario. One thing I did think was funny, that I
didn't mention in my original post is that if you listen only to
the tower, they mention the show control frequency about every 10-20
minutes, usually for the medevac helicopters ("Life Flite one,
contact show control for clearance, 126.0").

Saw both the Cleveland show (same control freq as last year :-)), and
the Latrobe/Westmorland County show. What a weekend!

Do you mean the one with the fancy remote control ?
It's tough and it's pretty. It's bloody illogical in the way the controls
work, but once working it's pretty good. The two antenna system is nice and
I have to admit that I like the remote. When new, it was *very* over-priced.
You were very lucky to pick up a manual. In fact, I didn't realise that a
manual had ever existed as I have never seen one.
By the way, has yours got the RS232 interface fitted ?

In article <34h6u5$j4k@crl.crl.com>, henniger@crl.com (Mickey R Henniger) writes:

How about the industry investing in a *very* small amount of foresight?
The industry had the technology to build a system that was secure and
instead chose to use a transmission mechanism that anyone could LEGALLY
listen to.

It's even worse than that. Not only is the voice sent in the clear, but the
authentication data is sent in the clear too. So anyone can forge a valid
ESN using data they snoop off the air. This of course has led to massive
fraud, which has led to the abominable roaming situation we have in the US
today. It also, as you note, led to the cellular industry buying the repeal
of the Communications Act of 1934.

In response to Dave Palmer's response to my post:

I wanted to say thanks to you Dave and post some additional info on 30 step in case others are in the same newbie boat I was just in-

Yes, pushing reset while scanning in the 800 bands does offer you 30 khz step- BUT, it doesn't add the 30 step position to the step button options- if, for any reason, when you go back to the 800's the 30 step is not activated, you just hit reset again and it'll come back.

Thanks again Dave- it works great!!!

I might suggest you get ICEs free catalog. They make extremely good
filters -- high, low, and passband, for everything from 100 KHz up.

Also DC active lighting surge protectors. All extrememly heavy duty.

Call 1 800 ICE COMM for free catalog and rf interference fact sheet.

After posting that I "already had a list of freqs to scan for the Blue Angels/Thuderbirds" I received a flood of mail asking me to post my list, so here it is. Nothing new, that I know of. These have been consolidated from several postings over the past couple of years.

This past weekend in Cleveland the Blue Angels were using 275.350 and 251.600. At the Latrobe/Westmorland Co PA airshow the Thunderbirds were using 141.850 and 322.600, with some support traffic on 413.100 (like, "Hey, get Jean-Claude Van Damme's autograph for Jim and I, too!" -- really! :-)). Note also that the 141.850 traffic was AM (glad I have a Pro-43!).

I bought a Silent Play and have been using it in my car for several
days with my Pro-43 and it works fine. At $15 I couldn't resist
having one to transmit to my headphones at home, but I quickly
decided to try it out in the car, too!

1766. Pro-51 New aquisition

Newsgroup: rec.radio.scanner
Date: 1994-09-06 19:31:41 UTC
From: jdavis02@troy.eng.eds.com
Message-ID: <34ig2t$9ji@pascal.troy.eng.eds.com>
Source record: 269323

Howdy folks,

I just aquired a new RS Pro-51 and I am VERY happy with it, especially since the selling price was $219, down from $299.

Unit doesn't have a bad 'birdie' problem that's prevalent in other scanners of this type. A nice, small hand-held. Pretty fast scanner. Has a lot of useful features, like 200 channels, preprogrammed WX, AIR, FIRE, MARINE frequency bands (don't count into your 200 channels), built-in charger, frequency scan up/down range... Seems to pick up a good range of signals.

There were a few Pro-43's left in the northern suburbs of Detroit. Only one radio in 4 stores had a serial number without an 'A' leading it, and that one was an abused display model. They were all still priced around $340.

So, considering the 'fumble keyboard mod' available on this radio, I think it was a good choice for the first-timer-really-wanting-to-get-into-the-hobbist.

If anyone needs a long/lat for Mid-Atlantic airports, I have the guide as well as several other relevant aviation publications that are useful for scannists for the Mid-Atlantic and Northeast regions.

Yes, you can. It isn't super-fast (it takes about 6 minutes for 400 channels),
but it's a lot better than programming the thing by hand.

ie this isn't a substitute, but rather a supplement, for the 6400-channel mod.
(which was recently expanded to 25600 channels!!)

Hi folks.. a short while ago I suggested putting together
a list of scanners and indicating for each whether they
are triple conversion and cell modifyable. Well, I'd
like to put such a list together.

So, will everyone "in the know" please email me details
about as many scanners as you know of. Don't send
any "I think" messages.

I need to know the make, model, whether it is double
or triple conversion, cell modifyable, and any notes
(less than five words) that absolutely must be included.
Notes should be something like "not mod-able after s/n
xxxxxx" (as is for the Pro43) or "ALL units mod-able"
(as is for the Pro2006).

Please do NOT send modifications or reviews. Just
those few details.

I'll post when it's ready.. keep sending me those snippets.

Thanks..

[snip]

Cellular calls can be tracked down to fairly "searchable" areas. The equipment an software is in place to assist with law enforcement efforts and is used everyday. It's not like a radar screen that will tell me what lane the guy is in but it will narrow a target down to cell sector.

If I was looking for a cellular subscriber and had cooperation of the cellular carrier, I could easily get a good idea where I should be searching for my "suspect vehicle". The cellular carriers will not do this just because the police ask - it requires a warrant just like a "wire tap".

> of the Communications Act of 1934.

True. I saw on TV recently, that anyone with this device the cellular
carriers make, which is about the size of a large book, can read the ESN
off of a nearby, in use, cellphone. With this ESN, one programs it into
another cellphone. It is just too simple, and the fraud is immense!
The cellular industry has no one to blame, but themselves. They're the
one's who created a system that is easy to de-fraud, and easy to listen
into. They should invest their own money to fix it, not just blame
scanner listeners, and the like, and try to have some unenforceable laws
passed to cover-up their own mistakes!

A book I have lists 'aeronautical telephones' at 849-851 mhz, and I'm
not sure if it's in AM or FM. I've have yet to hear anything when
searching such frequencies, which I think may have to do with the
location I'm at, and whether the plane is above me while someone
is actually on the phone. Anyone have some ideas??

I had one for three days before I returned it. It did ok, but the rubber duck on a suction mount did as well. I had/have my scanner hooked into my AM/FM antenna, and that does almost as well as an A/S mag mount, and significantly better than the No-Tenna.

MIR runs frequent packet radio stuff in the 2 meter
Ham band, at 145.55 Mhz. But, you can only hear them
when nearly overhead, and you need a TNC to decode
the packets, which are mostly automated anyway. The
cosmonauts rarley appear on 2 meter phone. But, there must
be other downlink freqs for them to speak to their ground
controllers. I'll bet you can't hear those conversations
from this hemisphere.

Well I still maintain that DTOA techniques could be used with a cell
xmitter to accurately pinpoint it. The trouble is having a suitable
group of satellites available with the proper receiving equipment
and directional antennas. With cesium time standards available on-ship
to get "good time" it appears that this is feasible. And of course
you need good directional antennas too. All of this is expensive
to do but for something like the "War on Drugs (tm)", this is
well within budget. (I wonder if the War on Drugs is really the
other name the Vietnam War was known by?)

Why you brought up GPS in the context you did is baffling. What bearing
does it have on this discussion?

>Once you know which sell the person is in - simple direction finding
>gear can pinpoint them fairly rapidly.

>
>Bill

the trouble is that you don;t have much time in many cases. Neat thing
about doing it from a satellite constellation is that you can do it
fast. The big problem is that you have to be looking at the right place
at the right time :-(

Of course I never said that CM was caught that way. However the fact
that he got on so easily has been the cause for many a discussion
at the FED level. The result, according to a well connected communications
consultant that I know that does work for the FEDS is a deployment
of a DTOA system as described above. The source further claimed that
within 5minutes of a future CM coming up that they would have his coordinates
nailed. If true that has to be some sort of a record for any law enforcement
agency to respond to anything other than an invitation to a Dunkin Donuts.

Thanks guys, I received a few messages about how to activate 30 step in the cellular bands- in cased folks missed it, you activate it by pressing the reset button while scanning the cellular freqs- if you go to another step setting while in scan mode, you have to press the reset again while scanning the cellular freqs to go back to 30 step- the mod does not add the 30 step option to the step list and it will not come up by hitting the step button. In fact, it doesn't even appear where the normal step setting is seen, it's higher up on the screen, same side.

As for 2006 mods, I keep seeing people mention some guy's book- I forget his name but would like to know the author, the title of the book, it's estimated price and a good place to get it... :-)

Thanks!

I have an idea Scott -

How about the industry investing in a *very* small amount of foresight?
The industry had the technology to build a system that was secure and
instead chose to use a transmission mechanism that anyone could LEGALLY
listen to. (all these laws were not in effect in 1979 when they started
building the infrastructure.)
[...]
The result is that freedoms are compromised.

Huh? As if my freedom as a cellular phone user isn't compromised by
people like you. Yes, the industry should have had some foresight,
but they didn't. What choice do we as users in this country have?
It's not like there's another cellular system that we can use.

[...]

If the phone company decided that they would design a system
today which transmitted private information by posting the information on
billboards, this rationale suggests that the correct solution would be to
pass a law regulating those who look at billboards.

No it's not. Billboards are intended as a one-to-many medium, and
every "user" of a billboard (the people who read them) use them this
way. Some radio transmissions, such as cellular, are one-to-one
transmissions, that happen to be recievable by others.

Sorry buddy. I dont listen to cellular communications.
I also do not appreciate a private enterprise doing a poor design job and
as a result spending alot of money to make laws which set an immoral
precedent.

>but they didn't. What choice do we as users in this country have?
>It's not like there's another cellular system that we can use.

How about not using the system because it is inferior?
How about not using the system as a private system since it is not?
How about using TDMA in cells that support it?
How about complaining to the private enterprises who created this mess?

Or would you rather just pretend that an unenforceable law will protect
your privacy?

Sorry Matt. Radio is inherently one-to-many. To argue otherwise is
arguing against the laws of physics.

>communications. <<

>The fact that the cellular industry *chose* not to employ encryption or other
>techniques does not, IMHO, give listeners the license (no pun intended) to
>eavesdrop on private calls.

The issue is not whether people who can should eavesdrop.

The issue is whether we should support an industry whose poor judgement
resulted in an infringment of liberties to all.

The precedent means that the government can outlaw citizens listening to
France or England on their shortwave radio.

It means that weather fax information could be made illegal to receive
from foreign countries if enough lobbying money was spent.

You make the example of people eavesdropping by looking through a light
at envelopes of mail.

I think a more appropriate example is an envelope manufacturer which makes
transparent envelopes. Why encourage enterprises which compromise the
integrity of the conversations they have been given the responsibility to
handle?

As telephone service providers they have the obligation to protect the
integrity of their customers.

They chose not to.

I think they should have. Because they did not assume the responsibility
which is theirs, they had to compromise our laws and set a dangerous precedent
that the government can say what is legal to *listen* to.

Excuse me? What kind of Draconian thinking is this?

[...]

>>>Other countries are doing it right. (e.g. gsm, jdc, ...)<<

>Sorry, but the motivation for these systems has a long list before privacy.
^^

Far be it from me to argue with the chief spokesman for the renown
"All Cellular Providers Everywhere Inc," but I believe there are privacy

advocates other than myself. I strongly believe in privacy and perhaps that
is where you and I differ. I'll let others speak for themselves.

>Quality of transmission, worldwide standards, capacity issues, etc., have long
>taken precedence over the natural encryption of digital signals because, in

>It's truly a shame that the regulators had to get involved in this, but if the
>"listeners" had given the privacy and courtesy to others that they probably
>expect in their own homes, this would never have been an issue.

You bet. Its the listener's fault that liberties were infringed...*NOT!*
The cellular providers built a faulty system. period.

>And as a point of information, the only infrastructures that were being built in
>1979 were experimental. Cellular licensing began in 1982 and the first
>commercial system was launched in October, 1983 (Ameritech in Chicago).

You are correct. You confirm my point that cellular towers started going
up in Chicago in 1979, and continue to expand to present day.

|
....and in another follow-up......

|> ...there must
|> be other downlink freqs for them to speak to their ground
|> controllers. I'll bet you can't hear those conversations
|> from this hemisphere.

The MIR space station uses the frequencies below, in addition to the amateur radio activity on 145.550 MHz.

143.625 143.420 142.420 MIR voice/data communications

121.750 MIR beacon, Soyuz TM-3 and TM-4

166.130 165.875 MIR data communications

142.423 Soyuz T-11 voice communciations

166.000 Progress 7 supply ship

Downlink signals on 145.550 are fairly strong with an outdoor antenna. Can't vouch for all of the frequencies, they're just the one's that have been published in previous postings. The signal from MIR will appear suddenly and drop out suddenly. If they're running AX.25 packet you'll hear brief bursts of data that sound like a 1200 baud modem on the phone. You need the TNC box to decode them since the uplink and downlink frequency of 145.550 means that some of the packet buzz may be terrestrial signals uplinked to MIR rather than you hearing the downlink from the spacecraft. If the cosmonauts are on VHF phone they generally speak good English with a distinctive accent.

There is little of interest in this range but surveillance bugs... why
anyone would find this interesting is beyond me. Jerry is correct in
that the Int'l versions of the 43 have different coils, etc. specifically
for listening to 54-88. Bob Parnass has said simply restoring 54-88 Mhz
by putzing with diodes yields horrible receiver performance in this band.
Personally, I wouldn't bother...

I was on an American Airlines flight from Albuquerque to Dallas this past weekend and since I've heard those calls on my scanner between 894-896 (AM), I had to try the Airphone (tm) myself. I called my dad (since it was his 75th birthday) and wished him a "happy birthday from 30,000 feet!" The call was scratchy aand didn't sound any better than it usually does on my scanner. By the way, I did have my scanner and I was able to hear some ground calls (base side) between 849 and 851 while we were at cruising altitude. Of course, I put my scanner away prior to landing. The AA magazine has a section in it about what electronic equipment can/cannot be used during specific parts of the flight. Scanners can *never* be used, according to the magazine (the stewardess asked us to read this for more information about legal electronic devices) but they said nothing to me while I was listening to my MYT-7100! Too busy passing out food and drinks, I guess ;-)

Air to Ground Telephone

Ch Ground Airborne

1 454.950 459.950
2 454.900 459.900
3 454.850 459.850
4 454.800 459.800
5 454.750 459.750
6 454.700 459.700
7 454.725 459.725
8 454.775 459.775
9 454.825 459.825
10 454.875 459.875
11 454.925 459.925
12 454.975 459.975
Signaling 454.675 (459.675)

Transmissions are FM. Ground stations repeat the airborne half
of the converstion, and transmit a continuous tone when idle. From
one to three channels are assigned in a particular area.
Service is used on private aircraft.

---

800 MHz Air to Ground Telephone

- - Airborne - -
Blk Ch 1 - Ch 29

10 894.0055 - 894.1735
9 894.2055 - 894.3735
8 894.4055 - 894.5735 Guard Band -
7 894.6055 - 894.7735 .x765-.x797
6 894.8055 - 894.9735
5 895.0055 - 895.1735 Control Channels -
4 895.2055 - 895.3735 .x813-.x973
3 895.4055 - 895.5735
2 895.6055 - 895.7735
1 895.8055 - 895.9735

Transmissions are AM. Channels are spaced 6 kHz apart. A
specific block of 29 channels is assigned to each geographical
area. Ground frequencies are 45 MHz lower and do not echo the
airborne half of the conversation.
Service is used on passenger airlines.

card as backup to a personal check, don't you?

I recently shopped in Flemington, N.J., and there was a news clipping from the Star Ledger posted on an outlet's cash register with details of this law. Apparently, it is legal to request to see the credit card as a form of ID, but it is illegal to write the account number anywhere on the check. I think the droid was correct in requesting to see the credit card, however, he was not allowed to write the account number. He can look at it and say, OK, I believe you are who you say you are because you have a credit card with that person's name on it. Kinda stupid, but that's the way it works.

|> SSB, and < 30 MHz stuff. I already know all the great things it can
|> do, just want to know if there are intermod/overload problems..external antenna
|> etc.
|
From my own experience I can say that intermod/overload can't be
too bad with the AOR 8000, since I use mine connected to a Scanmaster
discone in my loft, my house is less than a mile from a band II (VHF)
transmitter which serves all of London, along with a 1MW erp TV transmitter.
On the civilian air band images of one particular FM station can be found,
but these go away with the attenuator switched in.
Not having owned any other receivers, I can't comment on how well it
performs compared to the YUPI,
but it got a positve review in Short Wave Listener Magazine.

A rather awesome handheld scanner. Covers 530-1600mhz continuous, and
has FM,WFM,AM,USB and LSB modes, meaning you can pretty much pick up anything
with it. SW reception is very usable, I regularly listen to the Pacific
Aviation bands, and can pick up stuff very clearly. It's basically got
everything you could possibly want in a mobile scanner. I think with the
new laws they would be illegal to import into the US, but I don't have any
problems here in New Zealand, and mine cost me NZ$1000, which is around
US$600.

Hello, I am doing a telemetry project and I am curious if this will work.

We want to transmit a audio fsk digital signal to the ground. Now, on the ground can we just buy a regular 70 cm band receiver and will it spit the same digital audio tone out of the back, and then from there is it possible to use some sort of tone decoder or modem/tnc to then change the tones into a digital output which can then be feed into a computer I/O device.

I am looking for some information about if this design will work, and if so what are some specific products that we can buy and where can I get them.

Any Help Please.
Thanks, Bill

Until recently, NASA Select Audio was retransmitted on
the WD8OXB Repeater, 145.410, in Commerce Township.
Lately, though, I have noticed a distant Canadian ID
on that frequency, and WD8OXB's machine appears to be
down.

There are many hundreds of cell.phone freqs. That is one reason the
cellular system works so well.

Just set your scanner to search from 869 to 896 MHz.

Interesting comment... people who read this group are
(hopefully) aware that their
cellular/Airphone/cordless calls are fair game to us scanner
toting outlaws. The
great unwashed masses are probably not aware that their
"private calls" can be
easily monitored. Having the ability to eavesdrop is a
powerful weapon. Just
because you have a weapon does not make it right to use it...

I'd like to see some discussion of the rights of the scanner
community and the
wireless service user. I am a member of both (I am a Pro-51
and a cellular/cordless
user) and I see some real problems for the "average Joe."

Or read a map! Sheesh! Probably ex-military. [<:-)

Maybe they just have orders not to be helpful over the phone.
In Canada, the Canada Flight Supplement (like the AFD) includes
Lat-Long for every airport and navaid right in the listings.
And veterans of rec.aviation will recall that the FAA publishes
the entire database of airport, navaid, and intersection co-ords.
in computer tape format at a price to cover tape handling only.
They even once gave permission to post those files for FTP!
So it can't be all THAT secret!

Sorry if this has been done already, but has anyone made an un-biased comparison of scanner antennas? What do I mean? Grove, for one, is always making inflated claims about the brands they sell. Radio Shack has the same style of antenna for 1/2 the price. How do they, if at all, differ? Discones are simple, but what about that center whip? Some have none! Icom makes a discone that comes with 50 feet of low loss cable and has N-type connectors on it (AH-7000). It's also $106.99. Is it better by far than the Comet for $49.99 without the cable? Scanner beams? They look alot like TV type Log Periodic beams to me, but more money. Anyone tried a few? Nothing beats a hands on review. Sure they SAY it's great on 800. Is it? Enough with the "Will my WizBang-1999 get cell phones?" A radio is a radio, for the most part. It's the antenna that REALLY brings in the signals, or not, as the case may be. Besides, a new antenna with a 30 foot push-up pole is a lot less money than the latest PRO-?

Thanks.

>Huh? As if my freedom as a cellular phone user isn't compromised by
>people like you. Yes, the industry should have had some foresight,
>but they didn't. What choice do we as users in this country have?
>It's not like there's another cellular system that we can use.

Sorry, but that arguement doesn't wash. You know full well that you are transmitting your conversations
over the airwaves where it can be received. You know that it also applies to your cordless phone as well.

So why are cordless phones exempted from the ECPA of 1986? Simple. The cordless industry didn't throw
a lot of money at a tachnologically-challenged Congress. The cellular industry finally woke up real
fast and reacted -- real fast.

You can also begin to ponder why sensitive military transmissions are scrambled. Shouldn't be too hard to
pass a law banning military monitoring, right?

: >H: With a driver's license and a major credit card.
: >M: You do realize that's it's illegal to request a credit
: card as backup to a personal check, don't you?

: I recently shopped in Flemington, N.J., and there was a news clipping from
: the Star Ledger posted on an outlet's cash register with details of this
: law. Apparently, it is legal to request to see the credit card as a form
: of ID, but it is illegal to write the account number anywhere on the
: check. I think the droid was correct in requesting to see the credit
: card, however, he was not allowed to write the account number. He can
: look at it and say, OK, I believe you are who you say you are because you
: have a credit card with that person's name on it. Kinda stupid, but
: that's the way it works.

The reason they like the credit cards as IDs, is because some stores claim
that if the check bounces they can just charge it... of course, even before
the laws against that... it was pushing it, since they wouldn't have your
signature on the charge slip and you could deny the charges.

Little rules make little people feel big.

That's why I made up a "f** you" picture id card... "In America you're
innocent until proven guilty. You got it backwards, you deserve to be
insulted." Followed by the ID No., my name, address, date of birth and
signature.

It is amazing how little some businesses want your business. Like Radio
Shack at Gurnee Mills Mall, they bitched me out for writing a check with
a "red pen." So, they lost the sale almost a year ago, and I haven't set
foot in since. I previously made purchases about once a week, and often
(and without program) used a red pen.

1838. RS Car Antenna Splitter Question

Newsgroup: rec.radio.scanner
Date: 1994-09-07 21:54:12 UTC
From: dingman+@cs.cmu.edu
Message-ID: <34lcq4$j31@casaba.srv.cs.cmu.edu>
Source record: 269226
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Okay, here's a probably simple question: On the antenna
splitter from Radio Shack each of the three connectors
has a "name":

One female connector is marked "Antenna"
One female connector is marked "FM/AM"
The male connector is marked "FM Only"

My guess was that for some reason the splitter would
only pass AM to the "FM/AM" connector, and since I don't
listen to commercial AM that often, and listen to
Aircraft band (civ and mil) quite a bit, I thought I'd
connect this jack to my scanner, and "FM Only" to
the car's radio [BTW, I have no way of knowing if this
FM/AM referrs to the modulation technique or the
transmission band, since lots of folks talk about AM
as a band].

Okay, so I'm happy. It works fine. Then, on the road
on Monday I want to listen to the Raiders/49ers game
and I think, CRAP! I dont' have AM. But, I tried anyway
and got WMVP1000 out of Chicago (in PA, no less! :-)).

So, what DO these markings mean? Are they just there for
added confusion?

On a plane, if you read all that literature in those back seat pockets
(except the air-sick bag), usually in the airline's flight magazine,
there is something that says that use of any type of radio on an
airplane is against FAA regulations, but things like laptop computers,
and listening to cassette tape players with headphones, is OK.
My only question is, my portable cassette player also has an AM/FM
radio on it. The flight attendants never check to make sure that
you're listening to a tape, not trying to listen to some radio station
below. It just makes me wonder, in the future will some airline blame
their plane that crashed, because some passenger turned on this type
of radio that messed up the plane's navigation system? I doubt it.
I can't see how a $20 cassette/radio that you can buy at K-Mart, will
mess up the systems of a $80 million dollar jet.

Dave Pozniak (eth@tiamat.umd.umich.edu) wrote:
: A while back I thought that some one mentioned that you were could have
: scanner in your car in Michigan if you had a FCC license of some kind.
: Three questions, 1. Is this true? 2. What type of license is it? 3.
: What do you have to meet to get this license? (Age, type of scanner)
: Also if anyone has freqs for the Detroit 313 area, please email

There Is no FCC Licence for scanners in cars, Some hams will say that
their ticket does make it legal (in my opinion it does) if you read the
way the laws are written... But the legality of carrying a scanner in
your car or for that matter on your person is up to the individual state
you are in...

Here in Indiana you must be a law enforcement or emergency official
(fire, ambulance, Civil Defence, etc.)
or A Member Of the press WITH state credintals
or you may carry a scanner in your county of residence if you have and
carry a letter of authorization from your county sheriff.

this is a general idea of the law not ment to be legal, so don't take my
word for it...

From what I now know, it's the 'tower' frequencies (869 - 894 mhz) which are best to hear, in which you usually hear the cellphone half of the connection in lower volume (sometimes, not at all).
Tuning into the 'handset' frequencies (825 - 849 mhz, about 45 mhz lower), you may not hear anything, as a search using your scanner my just zip right through without stopping. Reason being, cellphones only emit from .3 watt (cheapest hand-helds) to 4 watts max (car phones/transportables). So unless you're fairly close to the cellphone transmitting (from a couple blocks to a couple miles) your scanner may not pick up anything. I don't think it has as much to do with the model of the cellphone, as it does with the performance of it.

Shawn4sk1 (shawn4sk1@aol.com) wrote:
I know which diode and I know its effect in general but SPECIFICALLY- If I do get cut the diode and get the 2006 to scan faster, a)how much faster will it scan? b)will the speed button still offer a faster/slower option? and c)will it possibly cause me to lose alot of freqs I might otherwise catch, etc?

I figure the "c)" question is kinda a dumb one b/c I figure the idea is to be able to scan bands faster for the ability to cover a range quicker. BUT, I figure the original designer set speeds appropriate for the processor, etc as to be as fast as it could be under the design conditions- I figured if it could scan faster accurately, they would've made it that way to begin with... no???

Thanks In Advance!!! This is important as a soddering gun is not readily available to fix it if I'm disappointed by my surgery! :-)

It's interesting to me that there didn't seem to be very much on most of the newsgroups about listening to cell phones until the law was passed which made it illegal to import/make cell-capable scanners. Now, it seems as though EVERYBODY wants to listen in on cell phones. In a couple of years, I predict that the two PRO-2006's I bought a couple of years ago, and never modified BTW, will be worth some big money. It reminds me of children who want to do something they were just forbidden to do. Too bad the scanner-banners never realized that by raising all the fuss, they just piqued everyone's curiosity (what is it I'm not supposed to hear? Just what are they hiding?) I guess it's kinda like a beautiful woman deciding she wants to change into her bikini out on the beach. So she yells loudly her intentions, and forbids anyone to look. Figure the odds!

Are there any scanners with a frequency counter built in? This would allow one to automatically tune in to the nearest transmitter in the area. Do such beasts exist or would Big Brother consider such a radio to be too "dangerous"? I really don't see the addition of freq counter circuitry adding too much to the bulk to the typical handheld scanner.

Does anyone have any mods for the Uniden/Bearcat BC170 Scanning Radio.
It currently has only 16 channels. Thought it could be modified for more.
Thanks.

1866. AOR AR 1500 question

Newsgroup: rec.radio.scanner
Date: 1994-09-08 07:06:46 UTC
From: quon@leland.Stanford.EDU
Message-ID: <34md66$svn@nntp2.Stanford.EDU>
Source record: 269044
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Hello,

I just picked up an AOR AR 1500 and was wondering if it is possible to
manually entering a starting frequency and have it automatically *search*
upward from there.

After reading the docs, it seems I have to do SEARCH PROG ...
Kind of annoying if I just want to channel surf. (By using the down
arrow key after I enter the frequency manually, I can search downward--
Unfortunately, there is no up arrow).

Any help or info will be appreciated. E-mail is preferred.

Thanks,

Ken (quon@leland.stanford.edu)

1867. San Antonio freqs?

Hi there. I will be travelling to San Antonio, TX @ the end of the
month, and I would like to bring my PRO-43 along. Could anyone pass
along the local PD, FD, & EMS channels? Also I would appreciate it if
someone could clue me in regarding the local laws, etc?

Thanks in advance,

Phillip Hoag -- "NO FEAR"?! I'm scared s--tless, but I get paid for it!

Source record: 269173

Could anyone who might have a set of freqs for Stanford lying around please E-Mail them to me... I've just started a job out here and would like to listen in on the action while I work. I'd be particularly interested in the "Stanford One" helicopter frequency (she flies overhead at least twice a day) but would graciously accept any frequencies (security, police, fire, etc.)

Thanks a million. E-Mail to "rudyw@sherlock.stanford.edu" is preferred.

>
> Danny

Since posting the note Danny quoted I tried my "Silent Play" transmitter *right next* to my Pro-2004's little whip antenna. I noticed no desensitation effects. The "Silent Play" xmtr really must be pretty weak!

So... My new plan is to mount the Pro-2004 in the rear of the car, near the regular car radio antenna. I'll arrange for a coax relay to switch the antenna between the car stereo and the scanner, and let the Silent Play send the audio to the car stereo tuner. Since the stereo will be in 'radio' mode the antenna will be extended automatically, so no need to kluge that. A remote control keypad for the scanner (or, heck, an HB-232 and an MS-DOS-compatible palmtop) and I'll be all set... now if only there was away to have the power antenna automatically adjust to various lengths for various VHF bands... :-)

Very nice in the car at night.....and dangerous if you tried to
program while moving !

Never got to grips with the remote although I guess having not
used one very often it took a bit aof learning each time I picked
it up. As you say very illogical to program at times.
Selectivity/Sensativity was not as good as some.

Don't try to power it from anything less than 1 amp - it won't
like it. The two antenna system is excellent and would be nice if
seen on a few more "home base" sets.

Should have been a manual with it when originally purchased. The
ones we had from Japan always came with an English ('ish) book. If
you need one E-Mail me, I still have some copies left.

> By the way, has yours got the RS232 interface fitted ?

Nope, never saw one. The original fliesr from Japan showed a RS232
fitted but the ones we had never came fitted with one.

> ... the cell.phone freqs?

From the FAF - Frequently Asked Frequencies file on oak.oakland.edu:

Cellular Telephone

Chs Freqs (base) System

800-832 869.040 - 870.000 RCC - voice
1-312 870.030 - 879.360 RCC - voice
313-333 879.390 - 879.990 RCC - data
334-354 880.020 - 880.620 Telco - data
355-666 880.650 - 889.980 Telco - voice
667-716 890.010 - 891.480 RCC - voice
717-799 891.510 - 893.970 Telco - voice

Mobiles transmit 45 MHz below the base (824.040-848.970) and
are usually repeated by the base. Channels are .030 MHz apart.

I did do the mod and I'm very happy with it- I would have now idea how anyone without proper equiptment and alot of free time because they don't have a job could figure the percentage of speed increase- I've heard 16%, 20%, 25%, etc... All I know (the "good" side! :-) is that it does scan so quickly, the last few digits aren't even readable anymore- I'd recommend it to anyone who hasn't done it yet.

Also, one guy wrote and said he replaced his clock crystal with a faster one and improved CPU speed by a third, I believe he said, to make it even that much faster- that's my next "Let's VOID the warranty" project. :-)

>>>
I haven't read the actual FCC regs yet, but I had been assuming that
the GMRS license applied only to the licensee and his/her immediate
family, and have hesitated in getting radios for that reason. Is it a
legal use to hand a radio to non-licensed, non-family member and
communicate with them?? With CB's, I know it wasn't.
<<<

It is not legal to do this. The only persons eligible to be station operators under a license issued to an individual person are the licensee and members of the licensee's immediate family living in the same household (FCC Rule 95.179).

Non-licensed friends, employees etc. are not eligible to be station operators under someone else's license.

This rule was enacted after lengthy study by the FCC and public comment by the GMRS community.

Anyone contemplating getting into GMRS should obtain the publications and newsletter of the not for profit Personal Radio Steering Group (address given elsewhere in this thread). Especially you need their Licensing Guidelines, GMRS Rules and the GMRS National Repeater Guide - now going into its tenth and most massive edition. The newsletter is called Personal Radio Exchange.

They also have a good introductory 8-pager called What is the GMRS? covering rules, frequencies, communications range, and understanding your local situation.

>to mod the scan speed if possible and lower the key beep volume when
>using headphones (Ouch, it hurts!)
>al.crowle@nt.com

Here is my experience with the 34. I never did disable the beep but you
may find the other mods interesting, including the scan speed mod.....

Pro34 Mods

Remove the four screws from the back of the unit, then remove the
batteries. Gently remove the back cover from the unit. You will need
to de-solder the antenna from the top board. Then remove the nuts
holding the squelch and volume pots. There may be a wire at the other
end of the top board to de-solder, which I think is mainly for
grounding purposes. Then, there are four hex screws holding the top
board on. Remove these and carefully wiggle the top board loose from
the bottom. I say wiggle because there is a multi pin connector to
unhook. Once unplugged, slide it out horizontally so that the volume
and squelch pots slide out with the board. Then there are three screws
to remove to lift the metal shielding from the bottom board. Once you
have the bottom board in plain view, you should see D9, D10, D11 and
D12 on one side of the board. Cut one lead of D11 and seperate the
leads so they dont touch. This removes D11 from the circuit and adds
the 800 mhz cellular phone bands to your scanner. It is a hassle to get
to D11, but the added frequencies are worth it in my opinion. Of
course, LISTENING TO CELLULAR PHONE CALLS IS ILLEGAL! There are other
mods that do various things to the diodes but these mods are of little
value. One, for instance, adds the 66-88 Mhz band but it also removes
the 30-54 Mhz band at the same time. In addition, many units won't
even pick up anything in the 66-88 band without major realignment. I
know mine won't! There is one other mod that's worth doing. I can't
remember the part designation, but there is a ceramic 2 Mhz crystal on
the logic board (probably blue in color), near the main CPU You can
replace it with a 3.4, 3.55 or similar value for increased scanning
speed. If you go over 4 Mhz, your CPU *may* not be able to maintain its
integrity. If you use a normal crystal, you'll have to bend the leads
over and lay the crystal flat over a nearby chip. It will fit though
and it works! Make sure the crystal leads and the crystal body are
insulated from touching any other circuits. If you use the two second
delay, it will be affected by the crystal. The delay time will be

reduced by increasing the crystal frequency. When you put the unit back together, make sure the key lock switch is intact. Mine fell out and I didn't notice it was missing until I had everything back together. Also, don't get the antenna connection too awful hot. There is a surface mount cap near the underside that will fall off if you apply too much heat. This is the input cap from the antenna. You'll notice decreased signal strength after you put it all together again. It can be a real bear trying to put surface mounted parts back on the board!! Trust me ;-)

Have fun. If you really screw up your radio, it's NOT MY FAULT !!!!!!

> do, just want to know if there are intermod/overload problems..external antenna
> etc.

In terms of senstaivity both the AR8000 & Yupiteru are very
similar, if anything at UHF frequencies the Yupiteru was a little
better. Initially the very first AR8000's were nowhere near as
good on HF/SSB as the Yupiteru, in later production a few design &
component changes were implemented which improved the performance
on SSB to somewhere near that of the AR8000.

The AR800 though seems to be considerable "cleaner" with regard to
imtermod.

I also find that the audio on the Yupiteru is "better" than the
AOR - this though can be rather subjective to personal preferences.

On the next deliveries there should also be a factory fitted mod
to stop the CPU crashes that happened on earlier models.

: : do get cut the diode and get the 2006 to scan faster, a)how much faster
: : will it scan? b)will the speed button still offer a faster/slower option?
: : and c)will it possibly cause me to lose alot of freqs I might otherwise
: : catch, etc?

: I have the 2006 and I did not do the speed mod for those specific reasons.
: As I recall it only gives you about 16% speed increase. and it is a
: diode that you cut. Not sure which one.

If you don't mind doing a little more surgery that involves drilling
some holes into the case, you can put micro-switches on the case, so that
you can turn the high-speed scanning fix on and off. (You could do this with
the Cell fix too.... but I don't see any reason why... to the best of my
knowledge, there is no decrease in performance.)

Does anyone know how the PRO-2021 fits into the RS scanner line and what other units it is related to? I'm especially interested if the PRO-2021 is a PRO-XXXX with the 800 MHz band disabled. For instance, if a PRO-XXXX has 800 MHz and is related to a PRO-2021, I can compare the two units and see what is different to see if I can re-enable 800 MHz.

I'm trying to see if I can get any more mileage out of my PRO-2021 before investing in a new unit.

Stephen

Hmm. I have a Modification book that describes moving some jumpers, then resetting the radio, then entering a code.
After resetting the microprocessor, (hold [MR] & [VFO], turn on and off, hold up & down keys and turn on) enter the following:
1200 [VFO] 1740 [VFO] 1400 [VFO] 1740 [VFO]
the book also says to press [Function] & [7] to change channel step.

The range should be 120-174MHz Receive, 140-174MHz Transmit

Good luck!

I recently bought a PRO-2028 from Rat Shack for $79 and was wondering
if anyone could give me some feedback on this model? Is it a reasonable
first scanner or should I try some other model? I have 30 days to decide if
I want to keep it. My understanding is that it is made by uniden, does anyone
know what the uniden model number is?

It scans up to 512 and can store 50 channels, are there any "mods" that apply to
this scanner?

Any information would be great!

Thanks,
Mike Turner

CAC> I was thinking about getting a Bearcat 2500XLT scanner for use at
CAC> airshows and listening into 220-400Mhz range. I haven't see nmuch
CAC> traffic go by about this unit. Any experiences good or bad?

Hi, Claude...It's good and bad, depending on where you live. If you live in a metro area, the radio will be plagued by intermod. They have since improved the unit since last year, when the unit was plagued with battery problems and intermod problems beyond the norm of other units.

It is an excellent unit to consider. 100 cps search rate, auto search and store, 10 priority channels, 400 channel memory, hit counter, and covers the band you are looking for.

Best thing to do is find a place that has a good return policy and try it out. If you don't like it, you can always try for the Pro 43. While alot of the features above are not included, it is also worthy of consideration.

Good luck...Jerry

This works on '51, '46, '23, 2026. Some of these modes work on the 220,
150 units by Uniden. From CompuServe Hamnet.

Subj: PRO-51 cellular trick Section: VHF/UHF Scanning
From: Howard Bornstein 76174,637 # 273839, 1 Reply
To: All Date: 02-Jun-94 05:47

There is an interesting test mode in the PRO-51 that, combined with the
direct search feature of the scanner, lets you pick up out-of-band
frequencies. You will have full access to the 66-88 Mhz ranges as well as
the cellular base range of 869-896 Mhz.

Actually, there are several test modes in the PRO-51 (most of these
comments should be true for any Uniden-made Radio Shack scanner, such as
the PRO-46). I'll describe them first and then how to take advantage of
one of them to get the restricted frequencies.

There are three data test modes. These modes completely destroy any
frequencies you had programmed into your scanner, so it's best to use
these techniques before you program your scanner. If you have already
programmed it, you'll have to decide if these new capabilities are worth
reprogramming.

Test mode 0. Clear the scanner.

A well-known method of clearing the scanner to all zeros is to hold down
the 2 key, the 9 key, and turn on the scanner. All frequencies will be
lost.

TEST MODE 1. Fill channels 1-25 with test frequencies.

Press the 2 key, the 9 key, the L/Out key, and turn on the scanner.

This fills channels 1-25 with these frequencies:

1 30.050
2 40.840

3 49.900
4 138.150
5 162.400
6 173.225
7 406.875
8 453.250
9 511.9125
10 108.500
11 118.800
12 127.175
13 135.500
14 66.450*
15 76.825*
16 87.425*
17 157.800
18 482.3625
19 29.000
20 54.000
21 806.000
22 857.200
23 888.96*
24 911.500
25 954.9125

* indicates not within the PRO-51's normal coverage. More on how to use these in a minute.

TEST MODE 2. Fill channels 1-17 with test frequencies.

Press 2, 9, Manual

Fills channels 1-17 with these frequencies:

30.00, 40.00, 50.00, 140.00, 155.00, 170.00, 410.00, 460.00, 510.00,
54.00,
109.00, 118.00, 127.00, 135.00, 810.00, 860.00, 950.00.

There is also a display diagnotic mode.

Display Test Mode.

Press 2, 9, Band or 2, 9, Moni.

This put the display in test mode. Every annunciator and every digit element is turned on in a scan from the left side of the display to the right. To keep this test mode continuous, release the buttons before the first scan finishes. This mode does not affect stored memory. Press any key to exit this display mode.

Now, if you've decided to try test mode 1, you will find several out-of-band frequencies stored in your memory channels. Channels 14-16 hold frequencies in the blocked out 66-88 Mhz range, and channel 23 holds a frequency in the blocked out cellular base range. Once you have these

frequencies stored in a memory channel, the PRO-51's direct search feature will let you search though these ranges. In the cellular band, the scanner searches in the correct 30 Khz steps.

You don't have to keep these frequencies in these channels. You can move them to any channel in the scanner. First move them to a monitor channel.

While on a channel with one of these frequencies, open squelch completely. Press direct search button, either up or down. The direct search button puts the scanner into search mode and the open squelch holds the frequency. Then press the Monitor button. The frequency is now in the monitor channel indicated in the display.

Now you can move it to any regular memory channel in the scanner.

Enter the channel number
Press PROG
Press Monitor
Press the number of the monitor channel if the proper channel is not displayed
Press E(nter)

The frequency is now permanently stored in the memory channel. You can do a direct search from this memory channel at any time.

The 66-88 Mhz range mainly covers TV audio. However, there is a strange phenomenon concerning TV audio and the PRO-51. Channels 4, 5, and 6 audio fall within the 66-88 Mhz range, yet the PRO-51 will not pick up the audio frequency while searching in this range. However, TV channel 2 audio is at 59.75 Mhz. When you add the intermediate frequency of 21.6 Mhz, you get an image of the TV channel 2 audio appearing at 81.35 Mhz. This does come in, although raspy, since the PRO-51 is receiving in narrow FM mode while TV audio requires wide band FM mode for proper reception.

I'd be interested in anyone can verify that any of these test modes work on the PRO-46 or any other Uniden-made Radio Shack scanner.

Source record: 269270

-=> Quoting Nat Francis to All <=-

NF> I'm new to scanning. I recently bought an BC8500XLT for $350. I
NF> reasoned that it was Uniden's best scanner, and had the added benefit
NF> of an alphanumeric display (can program in a name for the freq
NF> display; e.g., Dallas Police).
NF>
NF> 1. Was this a mistake? Are there flaws in the design of this model?
NF> Is this model now discontinued?

This model is being discontinued. There should be a 9000 to replace it.
Whether it was a mistake to purchase the unit is up to you. There were
lots of flaws in early production models. Word has it alot of these flaws
were corrected. The only thing strange about the unit is that
alpha-numeric displays can only be used on the first 250 channels.

NF> 2. The technical specs in the manual are lousy. Anyone
NF> have info such as receiver sensitivity, etc.?

Uniden has always been privvy about the specs of their receivers.
Shouldn't be a whole lot of difference. Typically, Uniden receivers have
always been more sensitive than RS GRE made receivers.

NF> 3. I'm not particulary interested in cellular coverage, but...is there
NF> a way to modify this model for continuous 800 mhz coverage? I am
NF> picking up cellular in the 1268 - 1280 mhz range. These are images,
NF> right?
Yes, you are receiving images of cellular. And no, there is no hardware
mod for this unit.

NF>4. Without an alphanumeric display on scanners with 500 to 1,000
NF> channels, how in the world does someone remember what all of those
NF> channels are assigned to?
Most of us have been scanning so long, we just know what the freqs are.
<g>

NF>5.I can't program an alphanumeric display to
NF> the channels above bank J (251 - 500). Am I doing something wrong, or
NF> is this a limitation? The manual doesn't say anything about this
NF> limitation, and the ad pictures for this model clearly show an
NF> alphnumeric display on channel 500.
Answered in question number 1. Yeah, it was a little funny having
channel 500 w/ alpha displayed in it.

NF> Any help would be appreciated. Thanks.

Your welcome, Nat...Jerry

Mc> with BearCat. McIAS @ AOL.com

Grove did a review on the 8500 in Nov. 1993 issue of Monitoring Times. They did a trashing of the performance of this feature oriented unit. They did have some implied optimism, though. MT quote..."But even though a dealer reports 1/3 of the scanners are being returned by dissatisfied customers, that means that the majority (2/3) are satisfied."

Grove even had a discussion with Uniden engineers about the problems with the 2500 and the 8500. They have led to some improvements of each of the units. Whether they have helped is unknown as there are not many postings on either of these two units. Word has it from a user on CompuServe (yes, that 'other' on line service) purchased a 2500 when it first came out, then sold it. He bought another one that was manufactured in Dec. 1993. He loves the unit. So apparently, this one was cleaned up quite a bit. And believe me, this said user is very finicky on performance. <g>

lk> From: lkf104@psu.edu
lk>
lk> so i can enable the missing 800 MHz freqs in my pro-46? how?

Product: Realistic PRO-46 by Radio Shack
Purpose: Restoration of full 800 Mhz coverage

The modification of this unit is from the May, 1993 issue of
Monitoring Times, published by Grove Enterprises.

** Disclaimer: All modifications are done at your own risk. This
product uses surface mount components which can be easily damaged.
Do not perform this modification if you are not experienced with
this type of circuitry. This will void the warranty of your scanner.

** Listening to certain portions of the 800 Mhz band is prohibitted
by United States law.

Modification of PRO-46 for full 800 Mhz coverage with 30 Khz stepping
available.

1. Remove the battery pack, battery door and antenna.
2. Remove the four black screws from the back of the radio, then
push upward on the bottom of the rear of the case, carefully
swinging it upward and removing it.
3. Carefully insert a small screwdriver between the two boards
next to the interconnect plug in the lower right corner. Gently
pry the top board up to separate it and set it aside.
4. Unsolder the copper-coated plastic shield from the microprocessor
and set it aside. ** CAUTION!! Too much heat will damage the
shield. **
5. Locate the two chip jumpers imprinted with "0". Carefully unsolder
and remove both.
6. Solder one chip jumper across the two upper most unused solder
pads. (Soldering a jumper across the lower two pads changes the
30-50 Mhz band to 68-88 Mhz.)
7. Reverse steps 1-4. The modification is completed.

>: run through a limited access modem connection to the FBI. Hope this
>: clears some things up.
>
>So the RCMPs use MDTs for CPIC and for USA, NCIC via FBI? :)

Not exactly... The Ottawa Police (as do most of our urban Police forces)
have MDT's in the cars. The RCMP doesn't seem to have the terminals in-
car (Problems with keys jamming with donut crumbs ;->). The National
data-base is maintained by the Mounties. NCIC checks are run via the
CPIC mainframe. The main reason the RCMP doesn't have MDT's (IMHO) is
the tasking that they have! Small communties in the north, VIP protection,
airport security etc... Most of the actual chasing of bad guys is done
by the city police, regional police etc...

Hi, All...

Well, it looks like the ban debacle is continuing at Radio Shack.
Apparently, the FCC turned up the heat a little more and were able to get
the PRO-51 scanner removed from the shelves. This is in addition to the
PRO-23 and the PRO-46 that were removed last month. Here is another twist
that the FCC is pulling on Radio Shack...

This is from a fax sent to RS stores nationwide last Thursday:

BEWARE THE FCC ARE DISGUISING THEMSELVES AS CUSTOMERS IN ORDER TO TRY BUYING
THEM FROM OUR STORES. REMEMBER, THIS IS A CRIMINAL OFFENSE WITH AUTOMATIC
TERMINATION AND FINE. VIOLATION OF THIS POLICY REQUIRES YOU TO REPORT ANY SALES
OF THESE ITEMS TO YOUR DISTRICT MANAGER IMMEDIATELY!!

Jerry

>

Are you looking for a cell phone that will protect your privacy? There may be some kind of encryption if you have the bucks and are willing to put up with the hassle. Otherwise, your best bet is any digital phone if that service is available in your area. (Though you have to be careful as they do switch to analog if they cannot get a digital channel.) It is probably still possible to listen in on digital phones, but it is way beyond the capability of the casual user. Digital encodes voice into digital bits and puts several simultaneous conversations on one channel. I understand that some areas do or will offer some encryption or privacy features in addition. The major downside is purchase cost--digital goes for $400 up with most in the $600 area, at least around here. On the other hand, air time rates tend to be lower because they use bandwidth more efficiently.

Hmmm.. wonder if one of those 'cell phone to scanner' conversions would work with digital??

Note that the key word is 'casual'--probably some folks in this newsgroup who have already 'inadvertantly' picked up some digital.

All reports sofar have indicated that units having serial numbers that start with the letter *A* are _NOT_ modifiable.

The FCC-ID on the radio probably also has an *A* at the end, indicating that this is the later, unmodifiable version.

1929. RS PRO-2006, Speed & Cellular Mods

Newsgroup: rec.radio.scanner
Date: 1994-09-09 02:26:52 UTC
From: g9153402@huey.csun.edu
Message-ID: <34oh5c$ch3@nic-nac.CSU.net>
Source record: 269040

I just ordered a Radio Shack PRO-2006, as a second scanner, to mainly grandfather myself into a second decent cellular modifiable model, before supplies are exausted.
I understand the cellular mod, but I am confused about the scanning speed mod. The unit scans 26 frequencies per second, which isn't really that fast, when compared to scanners made today.
But on reading a file I ftp'd on the subject, the speed mod will only increase the speed 13%. So 26 x 1.13 would equal a 29.38 speed after the mod. Is it worth it? My concern is, doing that mod may degrade some other performance within the scanner. Anyone know of any problems, however small, this might do? I think there might be some.
My reasoning is, why would Radio Shack manufacture a diode, and have it installed in all these scanners, which did nothing but degrade the performance of the scanner? It just wouldn't make sense to me for Radio Shack to increase their cost of making this scanner, by putting in a diode that does nothing but degrade its performance. I see the need for the other diode (the cellular skip one to conform with a U.S. law) but none for this diode. Anyone know of any? As you see, I am concerned about cutting this diode too.

I posted the original article requesting a PC based DTMF decoder using a SoundBlaster compatible board. Since the posting I've heard from several people who downloaded 'dtmf101.exe' from oak.oakland.edu. Unfortunately, nobody seems to be able to get the thing to run. I left a message with the keeper of the archive at oak but he does not own a SoundBlaster board and has never run the program. Bottom line...looks like we're stuck.

1) has anyone successfully used dtmf101.exe?
2) anyone know of a program besides dtmf101.exe?

Thanks,

J.D. Hubbard

How's the DELAY rate? I thought that it would decrease the delay time,
so I have not had the guts to try it.

I posted to the group the other day about the Scanner Almanac collection by US Scanner Publications, 1-800-890-6999- well, I got one for Missouri- 207 pages, sectioned off by County- everything from Municipal stuff to McDonald's and even shows individual's freqs- pretty nice. Connecticut is $19.95, same as Missouri- prices vary by State so I imagine you'll end up with as many pages in yours as I did. It even shows a few maps and the cellular bands...

I was in the same situation and asked the same questions 3 weeks or less ago- I sped mine up and I do notice a difference worth doing it for, especially when you've put just a few into a bank and locked out the rest- it _really_ helps when you're monitoring conversations back and forth between 2 channels... I've had no problems and it seems no else has that has done it either- as for RS not wanting to put out a faster scanner... the World may never know...

> They didn't know anything about it, didn't have anything in
> the store like it and never did.

It's item number 270-1715. It is discontinued. It is in a box
that is 8" high, 5" wide and 2" deep. The box says "Video Game
Accessories" and "Silent Play" and "For Nintendo, Super Nintendo
and Genesis Systems". It has a picture on the front of a kid
no longer annoying the hell out of his mother.

They could be out, but the chain did carry them. I got two.
And it did help in finding them that I mentioned it was a
discontinued item. The sales person at RS confirmed, after
checking some database, that the item was, indeed, discontinued.

It is intereting that the airlines are so inconsistent about this. For example, the Delta magazine specifically permits vhf scanners while prohibiting AM and FM radios (as if a scanner did not support AM or FM modulation modes!). On the other hand, American Airlines prohibits all radios of any frequency coverage from being used on the flightrs.

This sort of ticks me off as I have a helluva lot more frequent flyer miles on American and therefore prefer to fly them in my nearly constant business travel. On the other hand Delta seems more willing to study the problem and to try to restrict as little as possible. Of course the whole subject is moot anyway as most flight attendants that I've had direct readouts on cannot tell the difference between a VHF scanner and a cell phone.

I once had to point out to a Delta flight attendant (note the gender neutral term, "very PC"!), that their publication specifically permitted the use of VHF scanners when I was spotted with my trusty Yupi merrily listening to the cops somewhere over Indiana/Ohio. She told me that her rule of thumb was "if it has an antenna, then it is not permitted". I then called her attention to the proper page in question and she became more informed of the rules she is expected to enforce.

I once suggested that we maintain a list of the airlines and ther reespective policies regarding the in flight use of scanners. Not too many folks seemed very interested so it eventually died out.

Here are the ones I remember:

American no radios of any type
Delta VHF scanners, Video tape players permitted
Reno Air no radios of any type

These are airlines I typically fly, It would be nice if the rest of you folks could make note of what is and is not permitted on each airlines. Maybe we could even get the list posted monthly with the introduction to scanning that is posted monthly.

This helped me, I hope it helps you...

Radio Shack PRO-2006 Scanner Mods
by Mark A. Day N4OQK @ CHO

Introduction

The PRO-2006 is probably the worlds most versatile scanner to date.
Modifications are easily implemented, and upgrade performance over stock
units tremendously. Enjoy, and keep scanning!

Mod#1 : Cellular restoration
Parts : NONE

To restore the missing CMT frequencies, merely clip diode D502.
It is located in the upper left corner of the CPU/display board.

Mod#2 : Scan rate increase
Parts : 16Mhz. Quartz Crystal - fundamental cut

Replace CX503 (12Mhz) with a 16Mhz crystal, clip diode D503 (near
D502)
The unit now scans at around 40 channels per second.

Mod#3 : Squelch hysteresis suppression
Parts : 100-200K ohm 1/8w resistor

Locate R152 (33K) on the linear PCB (main board). This is a tricky
resistor to get to, since it is on the bottom side of the board.
Remove this resistor, and replace it with a 100-200K resistor. The
higher the resistance, the less hysteresis will be present. I
found
100K gave me all the razor-sharpness I was looking for, without
sacrificing performance.

Mod#4 : "S" meter output
Parts : 10Kohm 1/8w resistor, 0.1 uf capacitor

Locate D33 on the linear PCB. Solder in the 10K resistor to the
ANODE
of this diode. Note this is not the same as TP2. Connect a wire
from
the free end of this resistor to a rear panel jack (RCA). Solder
the
0.1uf capacitor from the jack's center terminal to ground. Output
on

this jack follows the AGC voltage. Negative for no signal, goes
positive when a signal is present, increasing with signal
strength.
A 1Volt full scale panel meter makes a good "S" meter.

Mod#5 : Increased headphone audio
Parts : NONE

Locate resistor R228 (27 ohm) on linear board (near IC7).
Remove this resistor and replace it with a jumper wire.

Mod#6 : 6400 channel memory capacity (ADVANCED TECHNICIANS ONLY!)
Parts : Hitachi HM62256LFP-12 (256Kx8 SRAM) or equivalent (flat pack
required)
4 Position DIPswitch
10KOhm resistor SIP (or 4 10K 1/8w resistors)

This modification is complicated, so don't try it if you're not
fully
sure of youre ability.

1) Remove front panel from scanner, disconnect wiring harnesses.
You will lose all current programs (Sorry!)

2) Remove metal shield from panel CAREFULLY!
Remove screws holding CPU board in front panel.
Carefully separate CPU board from keyboard.

3) Locate IC505 next to CPU and remove it from the board.
Notice this is a 24pin IC, and that there are 4 extra pads
to the top of pin 1. All pin numbers given hereafter will
refer to the new 28 pin IC, with pin 4 being the old IC's
pin 1. Follow me? The pads for the new IC are already present.

4) To adapt to the new RAM, a few traces must be sliced.

A) Slice the trace connecting pin 28 to pin 26
B) Slice trace connecting pin 27 to pin 23 (bottom of board)
C) Slice trace connecting pin 2 to ground (bottom of board)

5) Install the new RAM, and connect a jumper from CPU IC501
pin 67 (+5V) to pin 28 of the new RAM.

6) To address the extended memory, external switches must be added
and connected to the unused address lines of the new RAM.
Just how you implement this is up to you. Regardless of how you
do it, you will need to connect a wire bundle from the new RAM
pins 1,2,23,26 to the outside world. I mounted a jack on the
rear
panel into which a 4 position dipswitch can be mounted.

7) Add pullup resistors from new address lines to +5V, available
at
pin 3 of the +5V regulator IC8.

8) Reassemble unit, installing all shields and ground straps.

9) Testing & checkout

A) With all switches 'OFF' enter '1000.000' into memory channel 1.
B) Toggle switch 1 to on and return to channel 1. Enter '1001.000'
C) Repeat for all switch combinations. Lockout channel 1 in each
of the 16 memory blocks. You now have a coded channel to key you in on which block you're scanning.
D) Enjoy 6400 channels of pure scanning power!

You now have:

16 Blocks of 400 memory channels per block
160 Search ranges (10 per block)
160 Temporary scratchpad channels (10 per block)

Notice that custom settings (delay/mode) are unique to EACH channel, but priority and speed are common to all blocks. You might dedicate a common channel in each block to be the priority channel

Sorry, but no.
Billboards are, by design and nature, a one-to-many medium.
Radios are, by design and nature, a one-to-many medium.

Regardless of your intent, the above is still true. If you use a one-to-many medium, don't bitch because it's not secure. Use a one-to-one medium or encrypt your communications.

What you have said above, is that I can stand up in a crowded theater, shout my private communication to its recipient, and then pass a law to prosecute all those who happened to be there to hear it.

The PRO-2021 cannot be modified to receive 800 MHz band. Some
people, however, have used an 800 MHz converter, such as the one
made by GRE, to convert the 800 MHz freqs to 400 MHz range,
which the 2021 can receive.

The RS catalog number is 270-1715. This item is now shown as a
clearance item so all stores may not have them. They were designed
to be used with the Nintendo games. Original price was $39.99.
The clearance price is $14.99.

I have a neat little program called PAGEME. It waits for the phone to
ring and then waits (a user specified amount) for say - 3 minutes, then
dials your pager and puts in a number (once again, user specified).
It doesn't use alpha characters. What it is really good for is if
you are waiting for an important call, but can't bee there. Like when
you play hookie from work.
Good Luck,
Patrick

I don't know what it has to do with rec.radio.scanner, but the solution to your problem is to call 18005551212, ask for SPORTY's Pilot Shop and call them for a catalog. You can order flight service directories with all the information you want or need for various geographic regions (something like 7 books cover the US). These are FAA publications and are very cheap. You can also go down to your local airport's flight service shop and buy the same books.

Oh, these documents do contain radio frequencies, too...

Hello,
I've been looking around for some web pages that contain mod's & freq's for scanners, etc. and haven't found that much, so I set up my own.. It's kinda cheesy, and it doesn't have that much yet.. .I got alot of the mods & freq's off of ftp sites.. Anyways, you can check it out:
http://dice.dac.neu.edu/Homepages/paul/index.html .. it's located in the "ascii library section".. If you have any comments about it, or if you got some mods or freq's that you'd like to see on it, email me... Thanks!
Paul

Also, if you know of any other web pages, lemme know so I can make some pointers to them.. Thanks..

The guy at my Radio Shack didn't know what I was talking about until I said "Nintendo" and "discontinued." Then he found it right away. They had about five of them on the shelf, and it is well worth the $15.

I use mine at home, and the range was a bit short for my needs - I would lose the signal if I went into the next room. I just extended the antenna a bit with 20' of hookup wire, and now it works fine.

>

I've spoken to airport security and they say that they look out
mainly for weapons through the x-ray. Imagine having to check
every electronic object (computers, TVs, radios, scanners,
phones, answering machines, fax machines, etc.); could take ages.

ray.

Mmmmm...nope can't be done I'm afraid. As you say you have to put
the two limits in the Search Prog routine and go from there. Don't
forget Search Bank 9 will autostore channels into Scan Bank 9 !

I'll take this time to let everyone know that I did go up to McDonald's with my handheld, sit in the parking lot, and check out various freqs (yes, someone said that might be a good idea...)- I found the outside on 35.02 and the inside on 154.600- both of those were listed before as ones I might find them on... My handheld is a PRO-38, not too fancy- Once I left the lot, I couldn't pick up a thing from the next lot over... I realize they're low power signals but lower than I thought. Ok, I asked the other day and I only got ONE response- I want to know of some good "antenna boosters"- I live 2 residential blocks from McD's- I have the 2006 and the All-Band from RS- I would think I could pick up a simple McD's but not from home- I can hear my harddrive hummm on the 154.600 though... :-)

Message-ID: <34q63h$gfn@progress.progress.com>
Source record: 269065

Appologies for not inserting this into the "Pro-43 The Truth" thread, but I am truly inept with vi.

I've just been notified by a friend that my Pro-43 is un-modifiable by the method posted here recently from the June 1992 issue of "Monitoring Times." He found no diodes and had do do more de-soldering than the mods suggested.

The good news is that he got it back together and it works fine outside of that magical 8xx bandwidth.

My scanner's serial number does indeed begin with the letter A, and the tag inside the battery compartment reads A4A.

I hope I've saved some of you some hassles.

You could also pick up a portable HF shortwave radio that has at least 40 memories. Many SW radios with memories also let you scan them. I have a Yaesu FRG-100 for example. Has 50 memories. Set each memory location (first 40) to the corresponding CB frequency (in the 26-27 MHz range), and scan thru them. The Yaesu is not really portable, but does run off 12V. Could find portable one to do same.

Hope it helps.

Mike

Listening to cordless phone is not legal in California, at least until someone challenges the law and gets it overturned. Look at Calfornia Penal Code 630-637 if you don't believe me.

The security folk really have no right to confiscate radios and scanners.
Inspect yes, but not confiscate.

On the other hand, if you USE the scanner in flight on an airline that
has not explicitly approved the use of scanners, the flight crew does
have the authority to confiscate the radio. If you resist that, you can
be charged with interfering with a flight crew in the performance of
their duties, which is a federal felony.

> discone? Lindy Williams

i suspect that your patio sliding door is double-paned. The distance
therefore between the two pieces of the antenna is likely to be well over
1 inch. This is most certainly MUCH further than an auto glass, and
probably would greatly weaken the "pulling" power of this antenna.

|>On a plane, if you read all that literature in those back seat pockets
|>(except the air-sick bag), usually in the airline's flight magazine,
|>there is something that says that use of any type of radio on an
|>airplane is against FAA regulations, but things like laptop computers,
|>and listening to cassette tape players with headphones, is OK.

Actually, Federal Aviation Regulation 91.21 states that any electronic device other than (1) Portable voice recorders, (2) Hearing aids, (3) Heart pacemakers, and (4) Electric shavers, are prohibited unless the airline is willing to stake its operating certificate on the device not interfering with navigation and communication equipment.

The airlines have bent to public pressure and are allowing the use of other equipment, like portable PCs and scanners, during the less critical phases of flight. Generally they want it all shut off before descending below 10,000 feet MSL.

|>My only question is, my portable cassette player also has an AM/FM
|>radio on it. The flight attendants never check to make sure that
|>you're listening to a tape, not trying to listen to some radio station
|>below. It just makes me wonder, in the future will some airline blame
|>their plane that crashed, because some passenger turned on this type
|>of radio that messed up the plane's navigation system? I doubt it.

NASA has an incident reporting system called the Aviation Safety Reporting System (or ASRS). Pilots, flight crews, and ground controllers can report mistakes, goofs, or problems to NASA for investigation without risking FAA sanctions.

There are quite a few incidents in the ASRS databases where navigation instruments in $80 million were noticibly affected by $20 radios, cell phones, and personal computers. In at least one case, a passenger who refused to turn off his PC after it was determined that it was causing interference was arrested on federal felony charges.

|>I can't see how a $20 cassette/radio that you can buy at K-Mart, will
|>mess up the systems of a $80 million dollar jet.

Just because you can't see how it could affect aircraft radios doesn't mean it doesn't happen. If you've ever had a problem listening to a radio when a PC is turned on, or seen annoying lines on your TV screen while someone is running a mixer in the kitchen, you've seen a little taste of radio frequency interference.

Regardless of how expensive the airplane is, if you interfere with the radio signals coming from a 100 Watt radio beacon a hundred miles away,

there's little the avionics can do to unscramble the signal. I certainly wouldn't want to risk a couple of hundred lives on your assumption.

In article <Cvs4qn.2uo@rci.ripco.com>, glr@ripco.com (Glen Roberts) writes:
|>It is amazing how little some businesses want your business. Like Radio
|>Shack at Gurnee Mills Mall, they bitched me out for writing a check with
|>a "red pen." So, they lost the sale almost a year ago, and I haven't set
|>foot in since. I previously made purchases about once a week, and often
|>(and without program) used a red pen.

A couple of years ago Radio Shack started a campaign to update their mailing lists by asking for your name and address on even cash sales. This little pitch starts off with, "May I have the last four numbers of your phone number?"

The first time I head this request, I answered "No". The salesman asked again, and again I said no. He then told me that without a name, address, and phone number, he couldn't complete the sale. I said that that was fine by me, and told him he'd just lost the sale.

Some people just don't understand that some of us just don't like being in all those corporate databases.

Not to burst any balloons, but in a couple of years, the cellular industry will be using a significant number of digital phones and no scanner I know of (other than a modified cellphone) can decode that.

I just saw a price sheet for Cellular One here in Portland and they are pricing digital cellular time cheaper than analog. A market solution to the dial-surfing dilemma they currently have. I prefer this to the legislative approach they have used so far.

In the past I have listened to cell phone calls. I have never found them interesting, I enjoy listening to other bands and services. However, just because I don't listen to the cell band, I am not going to say that no one can listen. Our legal system loves precedents, and outlawing the reception of one band can serve as a precedent. Sooner or later some Police Department will become upset with scanner owners and ask that scanners that pick up public service frequencies be outlawed.

I am in favor of being able to receive ALL bands, even the ones that I don't listen to. I also own two cell phones. If I have anything sensative or personal, I don't mention it on the phone. I had a bad experience with someone listening in on a cordless phone call with a scanner and I don't want to go through that again. I know when to keep my mouth shut.

My cellular sales rep told me with a straight face that no one could pick up my cellular calls. I knew he was lying to me. The cellular industry needs to spend some of its own money instead of passing the buck to scanner owners.

Look what is happening with firearms. First machine guns, no one cared except those who owned them and those who realized what could happen. Assault rifles are next. The government is going to do its best to whittle down the bands we can listen to. We need to write our representatives and let them know that they won't get our support if they don't support our rights.

1978. PRO-2006: downconversion from 1.4-1.8GHz?

OK all you '2006 guri:

I am in need of a way to downconvert INMARSAT/GOES freqs to something
the '2006 will receive... _on the cheap_ (relatively).

THere was supposed to be something in the oct. 94 Poopular Communications,
but, no joy. So, if anybody has any clues/plans/whatever, let me know.

I don't read this group regularly, so please eMail stuff to:
clark@brahms.amd.com

I can handle uuencoded files there as well.

Also, check out the 8/94 MT for a good 250 MHz RHCP helical for that
band. It also has the equations for a 1.6 GHz helical. Good stuff.

Heck, you don't even need a scanner to listen in - just use your own cordless phone. A lot of people haven't realized that if you take your cordless phone handset, turn it on and get a dial tone, and then unplug the base unit from the AC, the handset stays on, listening to its current 46MHz frequency and simultaneously transmitting on the corresponding 49MHz frequency. I suggested this to a friend of mine who was experiencing bad interference on his phone - he said later that the offending conversation came in perfectly clear, but he muted his handset so as to not interrupt it.

If this is something that some of you already knew, sorry about the bandwidth. It works really great with the 10-channel units.

>AND PLEASE DON'T BUY RADIO SHACK IT'S SHIT.

Some of their merchandise (like my '43) is actually quite decent - it's just those f*cking idiots that work for them.

I have had my alkalines in my radio for 1 month now and use the radio about an hour a day. Still going. The radio works great. A lot of the complaints are due to the area people are in. As far as the comment on imaging. I also get some imaging in the 900mhz ranges, so it must be an up conversion.

Maybe this may help shed some light on the airline / scanner delima.

There is good reason why they would specifically restrict the use of an AM/FM receiver: the FM band would create signals (add 10.? mhz to the receiving signal) in the aircraft band. If you were listening to a radio station at 108, you would actually be transmitting a small amount of energy near 118. This could interfere with the aircrafts radios.

Scanners don't emit frequencies in those areas since they usually don't tune in 88-108.

Try the Diamond D130J discone antenna rather than the RS one. The
construction is better (solid elements instead of hollow), and the
Diamond has an additional center element that the 2006 can use for its
lower frequencies. It cost about $20 more, but....

I'm not sure about the wireless (infra red?) connection, but it sounds
like it *might* work. If you do this, post the results

crisp@netcom.com (Richard Crisp) writes:
:
: Well I still maintain that DTOA techniques could be used with a cell
: xmitter to accurately pinpoint it. The trouble is having a suitable
: group of satellites available with the proper receiving equipment
: and directional antennas. With cesium time standards available on-ship
: to get "good time" it appears that this is feasible. And of course
: you need good directional antennas too. All of this is expensive
: to do but for something like the "War on Drugs (tm)", this is
: well within budget. (I wonder if the War on Drugs is really the
: other name the Vietnam War was known by?)

Directional antennas are totally unnecessary. The problems are the
lack of an accurate time base (as you pointed out) and a method to
compare the signal reception times down into the microsecond range.
Of course, I am talking about a terrestrial system here.

There would not be enough call for the equipment - even in the stupid
War on Some Drugs - to justify the cost. It is already possible to tell
approximately where a particular cell phone is. Combine that with a
mobile unit containing a directional antenna array similar to that used
on the Lojack system - and it becomes rather easy to find the phone. It
is also quite inexpensive - comparatively.

: Why you brought up GPS in the context you did is baffling. What bearing
: does it have on this discussion?

Because GPS uses DTOA technology.

: >Once you know which sell the person is in - simple direction finding
: >gear can pinpoint them fairly rapidly.
:
: the trouble is that you don;t have much time in many cases. Neat thing
: about doing it from a satellite constellation is that you can do it
: fast. The big problem is that you have to be looking at the right place
: at the right time :-(

There is no way that such a satellite system could be afforded. You are
correct that directional antennas would be required. However, not only
are you looking at $50 million or so per satellite, but the overhead to
precisely keep track of the exact satellite position (and update it in
real time) would be tremendous. I also doubt if a satellite antenna could
be made directional enough to pick out a particular cell phone. Remember
that there may be many phones in a city that may be using the same frequency,
on different cells, at the same time.

Me too, although I should say I love my PRO 2004. I'm in my easy chair and it is on the table to my left. Between us is an old Zenith laptop I've dedicated to running the CE-232 interface. I just bought the Commtronics unit a few weeks ago so I'm just starting to learn how to get the best use out of it. I really like the autoprograming feature. I just make up a file of frequencies in a simple spreadsheet program and then load them into the 2004. If I take the time to also add the identity of each freq to the file, I can use it as a lookup file while the scanner is running. Every time there
is a squelch opening, the computer displays the info.

I've just started to play with this toy, the program comes with a script language that allows for some fancy tricks like timed operation, search and log, search and log and lockout, and a bunch or other stuff I haven;t tried yet. Commtronics Engeneering has it's own BBS full of talk and tips about this machine. I think its on Fidonet.

I'm real curious about the Optoscan 456. I wish someone would report about what it can and can't do.

>will it scan? b)will the speed button still offer a faster/slower option?
>and c)will it possibly cause me to lose alot of freqs I might otherwise
>catch, etc?

I have not heard of anyone having a problem from doing the diode speed-up. On my PRO 2004 I removed the diode that blocked 800MHz and inserted that same diode in another spot to accomplish the speedup. I don't know if that is the same for the 2006.

Bill Cheek, the guy that created the CE-232 computer interface for the 2004-2005-2006 says that the replacing the crystal speed-up mod sometimes messes up the CE-232. (Maybe the scanner goes too fast for the serial connection to the computer.) I wonder if it is compatible with the Optoscan-456?

:
: Huh? As if my freedom as a cellular phone user isn't compromised by
: people like you. Yes, the industry should have had some foresight,
: but they didn't. What choice do we as users in this country have?
: It's not like there's another cellular system that we can use.

How is your freedom to use the phone compromised? Just because people can listen to your babbling - your ability to use it to babble is not lessened.

If you are concerned about someone overhearing the content of your call, use a landwire telephone. A slight inconvenience probably, but worth it for the added security.

The other thing you, and all other cellular users, can do is tell the providers to cancel your "service" - until they provide a decent encryption system. If their growth reversed, they would have such a system installed within a year.

: If the phone company decided that they would design a system
: today which transmitted private information by posting the information on
: billboards, this rationale suggests that the correct solution would be to
: pass a law regulating those who look at billboards.
:
: No it's not. Billboards are intended as a one-to-many medium, and
: every "user" of a billboard (the people who read them) use them this
: way. Some radio transmissions, such as cellular, are one-to-one
: transmissions, that happen to be recievable by others.

And, an unencoded signal that is broadcast is not meant to be received by many? Look up the definition of "broadcast" in a dictionary. If your signal was meant for one other receiver, then that receiver would be the only one that could receive the signal in the clear. The US Supreme Court made this rather clear with wireless phones - which have a much shorter range than cellular sets. Just because the cellular industry bought congress does not change this fact.

Force the industry to encrypt the signals, and I will support your right to privacy. Until then, you might as well be using megaphones to talk to the neighbor across the street.

For those who want to know the reason for the 54-88 MHz band being available in some versions of the PRO-43 and many other scanners:

54-88 MHz is the VHF-Low band in Europe. The police in Copenhagen, Denmark is (or was) on 84.700 MHz.

Ooops, I can probably be arrested (in Denmark) for revealing that.

>coverage from being used on the flightrs.

My unscientific thinking would assume that Delta would let you listen
to VHF 108-137 Mhz AM, because that's the air band the pilots are
supposed to be listening to. If their cockpit radios don't affect the
airplane's navigation, why should your scanner do it, since you're
doing the same thing?
But I can't see flight attendants walking up and down the airplane
checking passenger's scanners to make sure they're set on the right
frequencies. I just don't know how Delta would enforce it, but the
other airlines just take the easy way out (can't use any radios).

> regards clive

Your best bet is to try the HF frequencies used by the Goddard
Amateur Radio Club that re-broadcast shutle comms:-

3860, 7185, 14295 and 21395 KHz

You might try UHF freq's 259.70, 296.80 - I very much doubt you
will here much on these though, I don't know how much they are
used during missions now.

279.00MHz is used by MMU's.

Much of the shuttle's comms use the S & KU Bands in various forms but voice
links are all in together with loads of other data etc.

Air-to-Ground : 2205.00, 2217.50, 2250.00, 2287.50(Primary digital link)
Ground-to-Air : 2041.90, 2201.40 MHz

Message-ID: <34sevi$t3v@usenet.INS.CWRU.Edu>
Source record: 269119

First 2 questions.

Can you use the $2 coupon on the first purchase of the catalog?

If you buy a second catalog can you get $2 cash back if you bought the
second with a $2 coupon?

If the answer to the second questions is yes do this:

Pay two dollar for the catalog, use the $2 coupon to get another cat,
and return one of the catalogs for $2.

Now you have a catalog and you still have a $2 coupon to use and you have
your $2 back that you paid for the first catalog with.

Most of the time (not always) after the scanner has been on for about 15 min a " carrier" type sound and a distorted voice or howl/squeal is present when a transmission occurs; this occurs exclusively in the 134 - 135 mhz am range. this is an internally generated noise and is not interference. The problem always clears up after the unit has been on long enough, after 45 min or so.

I'd like to get the unit repaired, but I'd like to know what the problem can possibly be and the probable cost, etc.

Would RatShack be the only place where repair could be done? I'm not so sure I trust those guys anymore.

Just to throw in another point - Rat Shack is now selling these micro-kits for about $10-$20. One of them is a FM xmtr on a PC board. Not sure what type of range it has, and from the picture on the front of the box, it looks like a mono only xmtr. Not sure what kind of range it has, but if you were to use it in the car, I don't think you'd need a whole lot of power. Am hoping to try one one of these days - am waiting for the price to drop from $19.95 (I think), but after a while, I guess they'll bring them down... (now why can't they do that with the neat stuff they sell, like the digital voice storage IC <$17.99 for as long as I can remember>)? Bought one and liked it. Want to daisy-chain a couple more of them to record over 20 sec. But oh well. Hope this helps anyone who can't track down the "Silent Play" gadget.
Jim

As a former employee of RS I feel compelled to respond to the considerable Abuse that RS employees have been taking in this and other forums about the various nets.

First I must ask you if you remember the 'OLD' slip of paper sales procedure that was used ?
If you do you must also remember the unacceptable amout of time it took to complete a sale !

Then as now you were perfectly capable of using another name and address at any time you wished. Or in most cases NONE even though it was against company policy !!

You must also be aware buy now that RS !!DOES NOT!! use the information supplied in it's point of sale data base for any purpose other than RS needs. This information has never been and i assume never will be sold to other data base companies !!

I like you I assume do not like the idea of getting flyiers in the mail selling everything onder the sun. Just because I made a contribution to my local PBS station.
I always use a misspelling in the situations. Which allows me to know who is selling lists.
Did you know the PHONE COMPANY still does this ??

OK ! Heres the hard sell part...

Yes, I have to agree that the RS salespeople are somewhat less informed than salespeople in say a HI-FI store.
But look at the selection of products available in a RADIO SHACK store.
I know that when I was an employee, There were guys who were self made experts in many things. Some CB, some stereo and some Computers.

RADIO SHACK makes every effort to train employees in every area of sales but their video tapes take a great deal of time to watch because of the huge variety of topics.

Just because one of them doesn't know the frequency of the secret service office in tacoma on thursdays doesnt mean that the employee is an idiot.

When I was employed by them I found that the majority of those I worked with were incredibly interested in my ability to listen to 'COOL' stuff on the scanners in the store.

Oh well... FLAME SHIELDS UP !!!!

Hmmmmm..

Sounds like you are hearing images from the 155 to 156mhz range which are in FM mode thus the howling sound.

Next time you turn on the rig and hear it try setting a search bank to the 155 - 156 range in fm mode and see what you hear.
If strong signals are present there see just how strong they are by first turning the attenuator on.
Then if still strong remove the external antenna and repeat the attenuator sequence and finally with no antenna at all.

If you find that the signals are strong I would reccomend the GROVE FTR-5 filter which along with a good brodcast filter has one tunable filter inside that you can notch out the strongest one.

Sounds to me like you are getting strong signal overload and not a problem with the radio.

Let me know. I'm curious to hear what you find.

Good luck

Could someone "officially" explain STEPs to me? I think I have the basic idea down- If it's a 30khz step, the freqs will be assigned as, for example- 870.390, 870.420, 870.450, 870.480, etc. Right?

So is there ever anything in-between? And not by accident- I mean if the band area is allocated as a 30 step area, once they run out, do they have to get the freqs in-between approved for use or does the FCC just start dolling out the unused freqs?

Thanks in Advance!

Not a stupid question at all. To the best of my knowledge, there is not
supposed to be anything in between. The gaps are there so that each carrier
can have some space for its side bands; plus a little more to prevent
overlap. Hope this over-simplification helps.

>station at 108, you would actually be transmitting a small amount of
>energy near 118. This could interfere with the aircrafts radios.

>Scanners don't emit frequencies in those areas since they usually don't
>tune in 88-108.

Actually there are more frequencies used on board an airliner than just 118 to 136. Here are some examples:

Nav receivers (radiolocation) 108 MHz to 118 Mhz
VHF Com (two way) 118 MHz to 136 MHz
ILS Glideslope (Instrument Landing System) about 300 MHz to 350 MHz
Transponder (Interogated by radar) 1030 MHz 1060 Mhz
DME (Distance Measuring Equipment) 900 MHz to 1200 Mhz

There are other systems used on airliners but these are the primary that usually operate simultaneously for the duration of a flight (ILS is used for landing). In fact all of these systems are used by small private aircraft, not just the big jets. (I forgot to add LORAN and GPS - if the plane is equipped).

Receivers can cause interference on more than just their fundamental + IF (10.7 or whatever). Harmonics can be generated at multiples of this if the receiver is not well designed or is malfunctioning. I mentioned in a previous post that I have experienced interference from an FM stereo receiver at a distance of over 100 feet and more than 300 Mhz away.

All radios (avionics) used on commercially operated aircraft must meet tough technical standards of operation (TSO) set by the FAA plus appropriate type acceptance by the FCC. Your scanner has a Part 15 FCC ID sticker that meant something when it left the factory but with no maintenance requirements you really don't know what it's doing.

SL> Monitoring Times) has mods for the PRO-2021 (also year, and month of
SL> the issue). I can go to the local libary and look up the original
SL> article.

Hi, Stephen...
The speed up mod does work. (That would be the one in which you change
the value of one of the resistors.)

First, you will need one 15K-ohm,1/4 or 1/2 watt resistor, radio solder
and a small soldering iron, and simple hand tools. Make sure the radio is
unplugged from its power source, and that the 9-volt memory battery is
removed! As you will be working in the area directly connected to the
microprocessor, failure to heed this advice may prove fatal to your
scanner!! Now, remove the upper case-half only by removing the four
screws (two per side) on both sides of the outer case, as well as the one
screw on the rear apron of the radio which fastens the upper case to this
surface. Carefully lift up the top case section and unplug the white
plastic two-conductor speaker plug, allowing removal of the upper case
entirely to simplify working inside the radio. With the scanner sitting
upright and facing you, locate resistor R-147 (a 39K-ohm resistor to the
left-front of the main board almost behind the vicinity of the LCD
display). Care-fully snip the leads at the resistor body with a pair of
sharp wire cutters to leave as much of the existing leads as possible.
Solder the 15K-ohm resistor to those remaining leads. If you wish to
totally replace R-147, it will be necessary to remove the lower case half
and unsolder an RF shield on the underside of the board; soldering the
new resistor to the old leads simplifies the process. Reassemble the
scanner in reverse order of disassembly, reinstall the memory battery
reconnect the scanner to the wall outlet; re program the memory, and you
will now have a radio that scans and searches three more channels per
second an improvement you can see as the numbers fly by.

AD> in the serial number)? Thanks...

Hi, Andy...I wasn't aware that there were some 'A' units manufactured in March, 1994 until someone let me know about it. The 'A' units, to my knowledge, can't be modified for continuous 800 Mhz coverage. You might want to open the unit up and see if there is a diode in the D4 position. Tandy could have been in a state of transition and just put the sticker on it as an 'A' unit.

There have been no ill effects to clipping the diode other than the
increase of scan rate to 30 cps. We could speculate why Tandy didn't just
go for the 30 cps and eliminate the diode, but who cares? It works good
with no degradation in performance. Just enjoy. <g>

>soliver@ozarks.sgcl.lib.mo.us

There is a common misconception that radio transmissions cover
a single exact frequency. That a transmission on 870.450 is only on
that frequency and not on 870.451 or 870.449. This just isn't true.

Radio transmissions take up what is called "bandwidth". This means
that a transmission will take up some spectrum above and below its
center frequency. For narrow-band FM transmission (land-mobile, police
fire etc) this bandwidth is somewhere in the neighborhood of 10-15 Khz
(.010-.015 Mhz). A signal on 155.000 Mhz for example will go from
about 154.995 to about 155.005 Mhz. This all depends on the "deviation"
of the FM signal which for land mobile is usually +/- 5Khz.

Cellular transmissions are also FM, but use a little wider deviation
to allow a little better signal quality. Two signals on adjacent
channels (30Khz apart) will each "fill in" part of the space in between
and will actually overlap slightly.

So to answer your question, in between 870.450 and 870.480 there is
part of each transmission.

This may be getting a little deep for this group, but the amount of
"information" being transferred on a channel directly affects the
bandwidth. That is why land-mobile FM has a bandwidth of 15Khz,
broadcast FM stereo has a bandwidth of 200Khz, and broadcast television
has a bandwith of 6Mhz.

In a previous article, don.droszcz@aquila.com (Don Droszcz) says:

>From Don Droszcz: I just bought a Uniden Bearcat BC2500XLT, and I heard
>it can be moded to 800 MHz. Does anybody know abuout this? or if they
>do, can you please leave a message on how to do this. Thank you all for
>your help. DON
>

there is a mod. but you had better have steady hands to do it. Surface
mount, don't you know.

1. locate the microprocessor chip " Uniden UC-1513A" and the chip
resistor under it marked "104". With a magnifier and fine soldering iron,
unsolder the lower left-most resistor, and move it one pad to the left.
Resolder it there.

The radio will scan in 30KHz steps.

There MAY be another board design for this radio. In that case this mod.
MAY not work on the other design.

If anyone has a keyboard mod. I'd like to hear of it!

2038. Radio Shack PRO-2006 Mod. Info

Newsgroup: rec.radio.scanner
Date: 1994-09-10 22:40:37 UTC
From: g9153402@huey.csun.edu
Message-ID: <34tcl5$oif@nic-nac.CSU.net>
Source record: 268939

The below was ftp'd off of oak.oakland.edu. I take no responsibility for the following. Use the below info at your own risk!

From: rats@ihlpm.UUCP

PRO-2006 Modifications

NOTE: The Electronic Communications Privacy Act of 1986 makes it unlawful to monitor mobile telephones, including cellular. The following modification is intended only to restore continuous 760-1300 MHz coverage as originally provided by the design of the PRO-2006 microprocessor.

BE SURE TO TEST YOUR PRO-2006 FULLY BEFORE ATTEMPTING THIS MODIFICATION. ANY MODIFICATION MAY VOID YOUR WARRENTY.

824-851, 869-896 MHz Frequency Restoration

Tools Required: small Phillips screwdriver, small wire cutters.

Procedure: With the power cord unplugged, remove the two rear cabinet screws holding the upper cover. Lift off the upper cover, being careful not to stretch the speaker leads. Examine the inner, right-hand-corner of the front panel to find two glass diodes, labelled D503 (upper diode) and D502 (lower diode).

Using the clippers, very carefully snip the visible lead of the lower diode (D502) at its bend and slightly separate the cut ends. If it is ever necessary to send the radio back for warrenty repair, the diode leads should be carefully resoldered.

Reassemble, plug in AC cord, turn on scanner, and press RESET.

Keyboard Beep Delete

With the top cover removed as described above, locate connector CN3, a 15-pin connector with colored wires at the front of the main circuit board. There are two precedures which will stop the beep tone from being heard through the speaker; read both to decide which procedure you want to follow.

(1) Find the center grey wire coming from CN3 and cut it midway to disable the beep tone. You may wish to solder a resistor in series to reduce the beep volume, a trimpot to vary the volume of the beep tone, or a minature switch to choose between beep and no beep.

(or)

(2) Using a pair of needle-nose pliers, CAREFULLY pry the plug from CN3, revealing a row of pins. Locate the center pin (#8) which corresponds to the grey wire and bend it down flat, disabling the beep circuit. Reinsert the plug. The pin may be erected again later to restore the beep tone if desired.

This completes the restoration procedure. Reattach the cover and replace the screws.

WARRANTY REPAIR

Should it be necessary during the first year of ownership of your new PRO-2006 to exercise your warrenty, it should be carefully double-boxed (as you received it) and returned to Grove Enterprises. Be sure to include a copy of the original bill to establish warranty privileges.

You must prepay only shipping and insurance; return shipping and insurance to you will be paid by the dealer.

Grove Enterprises, P.O. Box 98, 140 Dogbranch Road
Brasstown, NC; 1-704-837-9200

There are two diodes behind the "3" key on the keypad. Clipping one restores cellular, clipping the other increases scan speed by about 13%. I did this to my Pro-2006 after the warranty expired and did indeed measure a 13% scan and search speed increase. I don't think this has had any adverse effects on the radio although its theoretically possible that the increased scan speed might cause the radio to miss some carriers - but this is purly speculation on my part.

Cheers,
Peter

>crystal, he cautions that it may or may not work. HAS ANYONE TRIED A
>CRYSTAL FASTER THAN 12 MHZ IN THE PRO-2006?

Yes, I have done the Crystal mod. I used a 16.630 MHz crystal from an old
cordless phone (no bull), and I got a big speed increase (approx. 46 channels
per second). I tried several different crystals, ranging from 16MHz to 39MHz,
and my results seem to indicate that the highest crystal freq. should be about
18 MHz. If the crystal is too fast, the 2006 just uses the 3rd harmonic (ie
a 39MHz crystal operates like a 13Mhz.)

From: ross@novax.llnl.gov

>>The Scanner Mod Handbook #2 says to replace the 12 MHz crystal with something
>>faster; however, the author, Bill Cheek, says he hasn't actually tried it. I
>>haven't either, although I'd be interested in knowing if it is a successful
>>mod.
>

Well gang, right after I got my Mod handbook 2, I tore into my 2006. At first I
tried a 20 MHz xtal, the processor locked up and not all the LCD display
segments were happy (I had already done the diode clip speed mod). So I tried
an 18 MHz xtal, same problems. I contacted Cheek (the author) and he reported
that 16 MHz was the safe upper limit as he had seen no lockups at that speed
and higher speeds had produced lockups on SOME units.

So I changed xtals again. The 16 MHz runs fine without any loss of sensitivity
and I find enough delay left to still be able to use it (a faster
microprocessor xtal shortens delay time).

My favorite 2006 mod is a wired remote control (Monitoring Times Aug 91 - Bill
Cheek). I added a few extra parts and can control the following functions from
a six foot detachable cord: Scan, Manual, Search up, and Search down. Searching
is a snap when you can't reach the keyboard or it is dark.

Gary

Subject: RE: PRO-2006 Scanning Speed Mod.

Well, I changed the crystal in my Pro34, which is the same type of crystal and harder to get to than the 2006; however, I haven't changed the 2006 crystal yet. Some of the following instructions come from the Scanner Mod Handbook Vol. 2 on removing the logic board. Please read it all before doing anything. If you royally screw up your scanner, IT IS NOT MY FAULT!!!!!

Before you start anything, make sure you are at a static safe workstation. Unplug the A/C power cord. Remove the top and bottom covers. Remove the 4 countersunk machine screws from thesides of the front panel, then gently pull the panel away from the main chassis. All wires and cables will have to be disconnected from the top and bottom of the logic board (the board that the crystal is on). This will cause your memory channels to be lost and you will have to reprogram them :-((If you can work around it, you could leave CN-3, a 15 wire connector, connected to save your memories). At this point you may have to desolder a ground wire from the chasses going to the bottom of the logic board metal shield. Next, remove 6 small screws that secure the logic board to the front panel. Then, face the inside of the front panel placed in an upright position and locate the white 13-pin connector (CN-501) at the upper left corner of the board. This connector doesn't have any wires, just metal pins going into it. Gently pry this connector apart with a small flat blade screwdriver and the board should slip away from the plastic front panel and come loose in your hand. Also, you may need to remove the volume and squelch knobs. Desolder the metal shield at six places around the logic board and lift it up and off the board. This is fairly easy to do with a low wattage soldering iron. Apply pressure with your fingers while the shield is heated at each leg. As the solder melts, that leg of the shield will slip upward and pop free. Now there are two choices. If you have an air sucking soldering iron, you can procede to desolder each of the three leads. If you have a normal iron, this will be impossible. The remaining choice is to crush the crystal with a pair of needle-nose pliars until only three leads remain sticking up off the board. Then you can heat and remove each of the three leads. The center lead is ground. You will only use the outer two leads when installing the new crystal. It would be a good idea to insulate the body of the crystal with shrink tubing (whatever you do, don't use electrical tape!) to avoid it shorting out to another component. The crystal will have to be bent over so that the metal shield can fit back on top of the logic board. Before you completely hook everything back together, get the scanner in a usable state and make sure it works. It would be a real bummer to tear it all apart because something is wrong.

Hope this helps,

David

alt.radio.scanner
Subject: Pro2005/6 SSB MOD HERE!
From: horak@convex.com (David Horak)
Date: Mon, 31 May 1993 18:04:59 GMT

I had a few requests for this mod so I thought everyone would benefit...

This is the mod for adding SSB capability to your Pro2005/2006. It is taken in part from Bill Cheek's Scanner Mod Handbook Volume 1. As long as you have a shortwave receiver with an external antenna jack and capability to tune to 455 KHz, you can interface it to the Pro2006 with this mod. It is best if you use a static safe work environment to perform this mod and you should have some technical knowledge. Also, a schematic would be helpful but is not necessary.

You will need the following parts:

Output jack (I use a 1/8 mini earphone jack but some like a BNC. The 1/8 mono jack is easier to install because you don't have to drill as big a hole in the back of the unit)

.01 uF capacitor

5 Kohm resistor (1/4 watt)

6 inches of mini coax or other shielded cable

A cable to run from the 2006 to your shortwave. I use the shielded cable that has the 1/8 plug on one end and a phono plug on the other end (1992 catalog Radio Shack P/N 42-2444 works for me). The phono plug is perfect for the antenna input of my DX440 shortwave receiver.

The first step is to remove the cover of the unit and drill a hole in the back of the 2006 for your 1/8 or BNC plug. (You will want to wrap some tape around the drill bit about an inch from the end to keep it from cruising right on into the electronics once it punches through the metal!) Solder the 5K resister to one end of the .01 uF cap. Solder the other end of the cap to the shielded coax wire. Solder the other end of the coax to your 1/8 phono plug (or BNC) and ground the cable at this end. Now that the cable is in place you are ready to connect it to the 455 KHz source which is D33. It is on the top circuit board near the middle left, not too far from a huge capacitor. Solder the end of the resistor to the cathode of D33. (This should be the top of the standup part) Now you can test it out before you put the cover back on to make sure you did everything correct. You should be able to tune to some local airport or CB frequency on your 2006 and receive the same thing on your shortwave (with it tuned to 455 KHz and hooked up to the 2006 of course). If you tune something on your scanner that is SSB, you should be able to switch your shortwave to SSB and tune in the signal just fine. Beware of one thing, since the 2005/6 only tunes in 5 KHz increments minimum, you may notice from time to time that the signal on your shortwave isn't real clear. It may be that you will need to tune the shortwave anywhere from 451 to 459 KHz to tune in the signal well!

If you don't succeed or this description has you baffled you probably shouldn't be doing the mod in the first place. I assume no responsibility for screwups. Good luck

David

2039. Radio Shack PRO-2030 Mod. Info

Newsgroup: rec.radio.scanner
Date: 1994-09-10 22:47:03 UTC
From: g9153402@huey.csun.edu
Message-ID: <34td17$oif@nic-nac.CSU.net>
Source record: 268940

The below I ftp'd off of oak.oakland.edu. I take no responsibility for the following. Use at your own risk!

THE FOLLOWING IS INFORMATION ON HOW TO RESTORE THE PRO-2030, TO FULL 800 mhz coverage, as it was originally designed. But be aware, that monitoring of cellular frequencies may be against the law, in your country of residence. If in doubt, check with the proper authorities.

Modification to restore cellular frequencies in the Radio Shack PRO-2030 Scanner.

This mod is essentially the same as the PRO2026 except the location of the jumper is slightly different.

1. Remove power cable.
2. Turn unit upside down.
3. Remove five (5) recessed screws from bottom panel.
4. Carefully remove bottom panel.
5. With display panel facing you, locate the jumper marked L201 on the circuit board attached to the display. It will be about 2" in from the from and 2" in from the right side. It will look like a RF coil.
6. Cut the jumper marked L201.
7. Reinstall the bottom and reconnect power. Scanner is ready for use.
8. Cellular frequencies are now restored with 30 Khz channel spacing.

Please note: I picked up this mod from the FIDO net. I have never completed the mod myself because I own the 2006. But I do have the service manual and this is the diode that locks out the cellular band. Even the specs show this diode connected to pin 10 of the microprocessor. This pin is the STRAP OPTION CELLULAR SKIP. Too easy!

It depends on the store. Company owned stores, to my knowledge, were told to take them off the shelves and send them back. Evidently, some 2006's were made after the new law to effect in April 1994. But there are some RS franchises that still have them in stock, and other retailers (like Grove Ent.) and they're selling them until they're all gone. Once they are all gone, which probably will be very soon, if not already at most stores, they'll be gone for good. The PRO-2006 model is no longer being manufactured...

Not this again!!!! I guess it is theoretically possible to leave the
store with 1,000 catalogs, doing this. That is, if you want that
many catalogs, and the store is willing to sell them all to you.
But remember, for each purchase, you will have to fork out sales tax.
The coupon won't cover the whole purchase then, at least not in Calif.

But FYI, the newer PRO-2030 s (Radio Shack still sells them) don't have a
L201. I haven't heard if the new units are modifiable, but they may not.

Skip Lombardi (lombardi@bedford.progress.com) wrote:
: Appologies for not inserting this into the "Pro-43 The Truth" thread,
: but I am truly inept with vi.

: I've just been notified by a friend that my Pro-43 is un-modifiable by
: the method posted here recently from the June 1992 issue of "Monitoring
: Times." He found no diodes and had do do more de-soldering than the
: mods suggested.

: The good news is that he got it back together and it works fine outside
: of that magical 8xx bandwidth.

: My scanner's serial number does indeed begin with the letter A, and the
: tag inside the battery compartment reads A4A.

: I hope I've saved some of you some hassles.

Well, I have a strong suspicion that if a diode is *added* between
the two points the original diode was placed (even if you have to
trace the pads on an older unit to figure what chips / points on
the board it connected to) it *may* restore the cellular. Any
1N914 would do, Rat Shack used to sell them in packages of 20 for
a small price.

Really, this mystery is FAR from over. I mean we need to know many
important facts:

[1] Is the CPU the same one used in the INTERNATIONAL models?
[1a] If so, what is different?
[1b] If not, is this the case with newer, more recently manufactured
models?

[2] Are the pads still there where the diode used to go?
[2a] If so, has anyone tried adding a diode at the place you used to
remove one?

[3] We are assuming that new locked out in CPU means end of the world,
well it is dumb and stupid to think they would make one type of
CPU for the (small, growing smaller) US market and another for the
(larger and growing) international market. If the rule states it
must be locked out in CPU, has *anyone* thought that the new CPU
may have followed the law "to the letter" and not intent, meaning
it now tests for the absense of a component. Since they have not
documented "what the component is" nor "how to restore the newer
units", it would meet the letter of the law, because the can
simply state "modification is not a simply add a part because the

part needed is unavailable to those in the US and is not
documented". The point is, a 1N914 needs to be placed between
the two places the old one was removed from before we can assume
NO, it can not be done. If this is done and it still shows no
improvement, then I will believe it can not be done.

[4] Someone needs to compare the international model to the new US
version. I do not have the capital $$$ to do such a test, but
to the person who does so, he has the potential to make a fortune
by making up a kit of instructions and or parts and selling them
as a conversion KIT which is legal and can not be meddled with
by the FCC.

[5] What about the european restore mod -- for 54-88 mhz? I know
mine allowed it, that was where you re-installed the diode you
removed. Did they automatically include that segment in the new
model? This is starting to *really* stink of suspicion there
are ways to upgrade it -- still to be found. I say that because
I know companies do not stock 2 of everything for a product just
so they can supply international and domestic. They make the
products main components usable in both with minor modifiable
differences. Let's face it, there will not be enough US sales
to justify their manufacturing division to stock two boards, two
CPUs, two of everything... Radio Shack is not Noah's Ark!

No, I must conclude the evidence is still inconclusive. If anyone does
follow further on this from any of the above, please e-mail me in
addition to a posting here -- I would sure want/like to know!

Thank you,

Steven

From: af546@yfn.ysu.edu
Message-ID: <34tpcj$4vi@news.ysu.edu>
Source record: 268952

OK, let's talk average here.......Assuming the repeater was a 100 watt transmitter along with a receiver at .25 microvolts @ 10-12 dB SINAD along with the standard spurious rejection equivelants and a acceptable amount of selectivity.......add in a standard duplexer with say around 1.5dB RX and TX insertion loss all set say on a frequency pair of 452.050mhz/457.050mhz (RX/TX respectively).......say with a 10 dB omni directional antenna located say.......100 feet above ground level with the repeater on the "tenth floor" of a building using say.......25 feet of 7/8 inch hardline antenna feed......assuming that this structure is at a point of the highest terrain within a given radius of 40 miles taking into consideration of the curvature of the earth along with other various given locations where the elevation is equa to or greater than our system under "test".......using a mobile receiver with a rating of 15 % less of what our repeater receiver specs have to offer.........
taking into consideration of co-channel interference and other man made and atmospheric conditions.........opps! along with a 5dB roof mount mobile antenna........assuming that the terrain the mobile is exposed to is of hilly or rolling content............

Roughly 35 miles.......

CB'ers don't try this one at home <grin>

Seriously though a fraction of most of the above data could make a major change in "usable communications range".

Let's put int this way.....It takes BIG bucks to erect a commercial or public safety repeater system to get great distances especially when we're dealing with poor terrain etc.

Haven't heard of any. It may be the circuitry to get this range just
doesn't exist in the scanner. In any event, there isn't much to scan
in that range, as far as I know, aside from UHF television stations.
Purchasing a TV should work better in this range. Not only will you
hear the transmissions, you'll see them too! :)

Yeah, Chris,
Had one of those splitters in the car (and still do) for my ancient Regency Touch K-100 (smack it around, jiggle the knobs, wiggle the cord, cross your fingers and check for a pulse..) No difference b/n the AM & AM/FM outputs, at least to my ears. Maybe if you lived in a fringe area - but I don't know if there are any internal components in that thing either. At the very most, all that could be is a cap or two or mebbe a coil. Just thot I'd jump in and give ya my $ .02.

[Posted on 11 Sep 1994 06:51:40 GMT]

Hello. This may be a repeat post, but the news server here went spastic...

I will be traveling to San Antonio soon, and would like to know the most current freqs for FIRE and PD. I have "Monitor America", but it may not have recent changes. Also, I would like to know if there are any local laws regarding portable scanners there (I have a PRO-43).

Thanks in advance,

This does decrease the delay, but you can extend it to as long as you
want with a simple mod from one of the Scanner Modification Handbooks.

: : so you need to modify them to be able to hear cellular transmissions ?
: Not necessarily... see the answer above.
: --
: Paul Schuh UNCA Society of Physics Students

Cellular restoration is only one of many things you can do (depending on
the flexability of your scanner). You can add other frequencies, speed-up
the scan/search rate, increase memory, add a SWR meter, interface with a
computer, etc.

I don't know who invented it, but Bill definitely wrote it up in his newsletter. It's the same idea as the 6400-channel mod: Replace the RAM with a bigger one, and add a way to control the extra address lines for selecting which "bank of banks" you want.

Berton Corson (g9153402@huey.csun.edu) wrote:
: PRO-2006 Modifications
: Subject: Pro2005/6 SSB MOD HERE!
: From: horak@convex.com (David Horak)
: This is the mod for adding SSB capability to your Pro2005/2006. It is
: taken in part from Bill Cheek's Scanner Mod Handbook Volume 1. As long
: as you have a shortwave receiver with an external antenna jack and
: capability to tune to 455 KHz, you can interface it to the Pro2006 with
: this mod. It is best if you use a static safe work environment to
: perform this mod and you should have some technical knowledge. Also, a
: schematic would be helpful but is not necessary.
: You will need the following parts:
:- Output jack (I use a 1/8 mini earphone jack but some like a BNC. The
: 1/8 mono jack is easier to install because you don't have
: to drill as big a hole in the back of the unit)
:-.01 uF capacitor
:- 5 Kohm resistor (1/4 watt)
:- 6 inches of mini coax or other shielded cable
:- A cable to run from the 2006 to your shortwave. I use the shielded
: cable that has the 1/8 plug on one end and a phono plug on the other
: end (1992 catalog Radio Shack P/N 42-2444 works for me). The phono
: plug is perfect for the antenna input of my DX440 shortwave receiver.
: The first step is to remove the cover of the unit and drill a hole in
: the back of the 2006 for your 1/8 or BNC plug. (You will want to wrap
: some tape around the drill bit about an inch from the end to keep it
: from cruising right on into the electronics once it punches through the
: metal!) Solder the 5K resister to one end of the .01 uF cap. Solder
: the other end of the cap to the shielded coax wire. Solder the other
: end of the coax to your 1/8 phono plug (or BNC) and ground the cable at
: this end. Now that the cable is in place you are ready to connect it
: to the 455 KHz source which is D33. It is on the top circuit board
: near the middle left, not too far from a huge capacitor. Solder the
: end of the resistor to the cathode of D33. (This should be the top of
: the standup part) Now you can test it out before you put the cover
: back on to make sure you did everything correct. You should be able
: to tune to some local airport or CB frequency on your 2006 and receive
: the same thing on your shortwave (with it tuned to 455 KHz and hooked
: up to the 2006 of course). If you tune something on your scanner that
: is SSB, you should be able to switch your shortwave to SSB and tune in
: the signal just fine. Beware of one thing, since the 2005/6 only tunes
: in 5 KHz increments minimum, you may notice from time to time that the
: signal on your shortwave isn't real clear. It may be that you will
: need to tune the shortwave anywhere from 451 to 459 KHz to tune in the
: signal well!

: David
: Brad Steinman, N8ZRP

I get a squeal at 455kHz on my DX-440, so I asked Bill Cheek at Commtronics Engineering what to do. He said: "I think the DX-440 is receiving it's own IF at 455kHz, hence the squeal. You should first be sure all other nearby radios are turned off because 455kHz is a common IF frequency. If the DX-440 just has this as a problem, we can always tap 10.7MHz out of the PRO-2005 at pin 1 of IC1 and otherwise follow the rest of the steps..."
"This might actually give better results than tapping 455kHz anyway!"
I assume this would also be pin 1 of IC1 in the 2006, but check to make sure.

2062. Frequency for O'Connell High School? [REQUEST]

Newsgroup: rec.radio.scanner
Date: 1994-09-11 12:50:50 UTC
From: Schoen@ix.netcom.com
Message-ID: <34uufa$1v8@ixnews1.ix.netcom.com>
Source record: 268972

Does anyone have the frequency for O'Connell High School in Arlington, VA? This is a private, Catholic high school, so I don't know if they would have a business license or a local government-school license. I do know they use radios, because I have seen several people carrying and using them. They are Motorola radios with a medium length, thin, and flexible antenna. This implies they are in the UHF band. I have looked in Beyond Police Call, where they list another nearby Catholic school, but they do not list O'Connell. I have also looked in the Scanner Master book for Virginia/Metro D.C.

Thanks in advance for any help,

schoen@ix.netcom.com

What's that mod???

2064. Handheld Radio Antenna Lengths

Newsgroup: rec.radio.scanner
Date: 1994-09-11 12:57:22 UTC
From: Schoen@ix.netcom.com
Message-ID: <34uuri$25v@ixnews1.ix.netcom.com>
Source record: 268974

What are the average lengths and widths for handheld radio antennas? (e.g. UHF--3 or 4 inches and stubby) I am curious about this because Police Call gives descriptions of antennas on vehicles, but not on handheld radios. Also, it seems as though some bands can use two different types of antennas. Please clarify this for me.

Thanks in advance,

schoen@ix.netcom.com

: /* barry /&

I am not familiar with this item -- the FCC does not regulate
receiving devices and what is wrong with the new PRO-43s that
needs it to cease being made in 1999? Which rule/law is it
violating now? Is this just to keep the manufacturers busy making
new models? I do *not* understand it... Oh I do understand one
aspect, the international trade will skyrocket!

What *d* new *f* rule is this talking about (having to exercise some
restraint here, hence the *d* and *f* terms, you figure them out!)

This only would apply to units purchased in the US as there is no
way the US can impose its nazi style government on other nations!

It's time we went back to kits or atleast a device which in itself
is not a scanner or receiver, using software from a PC to drive it
and determine its range -- something the stupid idiots in the
whitehouse can't *f* with!

Tell us *more*...

2068. Re: Airliner frequencies

Newsgroup: rec.radio.scanner
Date: 1994-09-11 13:43:00 UTC
From: sysop@pfzrfsg.com
Message-ID: <29e.2597.21@pfzrfsg.com>
Source record: 268980

* In a message originally to ALL, Berton Corson said:

BC> My unscientific thinking would assume that Delta would let you listen
BC> to VHF 108-137 Mhz AM, because that's the air band the pilots are
BC> supposed to be listening to.

On a flight last year I was unaware of Delta's policy regarding scanners as published in their flight magazine. I wanted to use my Pro-43 so I asked a flight attendant if I could speak with the captain. I was taken to the cockpit and explained to the flight crew what I wanted to do. They asked me a few questions about the equipment. They were not sure what the policy was until the first officer remembered seeing something in their official flight procedure and regulation book. He looked it up and found essentially the same wording I later saw in the Delta magazine. After a few more minutes of discussion (they were very interested in the equipment) they told me it would be OK (with no restriction on the frequency) but not to use it during takeoff and landing. They were even kind enough to provide me with the frequencies they would be using enroute, including the company frequencies.

BC> If their cockpit radios don't affect the airplane's navigation, why should
BC> your scanner do it, since you're doing the same thing?

One argument I have heard is that the airplane's equipment is specifically designed and certified not to interfere with other electronic devices in the plane. This argument holds little water as it is inconceivable that the tiny emission from the scanner's 10.7MHz mixer could find its way to any onboard avionics with sufficient energy to cause interference.

BC> But I can't see flight attendants walking up and down the airplane
BC> checking passenger's scanners to make sure they're set on the right
BC> frequencies. I just don't know how Delta would enforce it...

During the flight a flight attendant saw me using the scanner (I had it propped up against a window and was listening with earphones). She asked me what it was. I told here that it was a radio scanner. She became concerned and told me she did not think I was allowed to use it (apparently also unaware of the official policy). I told her that I had cleared it with the captain. She then left (I should say that she was very polite during the entire exchange) and returned a few minutes later. She said that she had confirmed that I did have the captain's permission and reminded me to tun it off during the landing (we were airborne for about 20 minutes at this point). I was not questioned again during the rest of the flight (but did get some looks from other attendants as they went up and down the aisle).

BC> ...the other airlines just take the easy way out (can't use any radios).

I agree with this statement. When something is not understood, or their is no interest in understanding, the simple solution is the *ban*.

I would like to put in a good word for Delta. I was very impressed with the professional attitude of the crew, their willingness to be accommodating, and their assistance with frequency information. It made for a very enjoyable flight!

>>traffic go by about this unit. Any experiences good or bad?

I have both the BC2500XLT and the Pro43. (bot the 43 just because it was
being closed out to a "new non modifiable" unit)

I have liked the 2500 but it seems to have a problem with static now.
The 43 is very impressive, smaller and easier to walk around with.

The features on the 2500 are better, but for the money and size I
think that the 43 may be a better way to go.

Someone recently posted the name of a text on Spread
Spectrum communications. Please re-post. As I recall it
was fairly old but still pertinent.

While on the subject.... Am I correct in my understanding that
the real difficulty in decoding spread spectrum digital comm lies
in that there is no way, with present available technology, for
a computer to "know" when it has successfully decoded the transmission.
It therefore becomes a tedious, manual process. And since some
systems randomize the manner in which the data is coded each
time they are used, one must start over for every transmission.
How is this coding coordinated between the handset and base?
Doesn't one have to "tell" the other how to decode the signal?

To which Keith replies...

> There is a common misconception that radio transmissions cover
>a single exact frequency....
>
... much good stuff on *spread* of a complete signal and bandwidth
deleted.....

I think the original question though was about primary channels (central or carrier frequencies)... The part of the answer that interests me is how one knows when the step (particularly a large one) lies on that multiple of the step that starts at the official beginning of the band... A band beginning (say) at 850Mhz (just being hypothetical here) and using a 30khz step might start (have its first assigned channel) at 850.010Mhz and then go to 850.040, 850.070, etc. I suppose this would be a most EXCELENT application for a scope like the Grove SDU-100, but what if you DON'T have one :-)?

Still to answer the question (I hope), YES, there are sometimes to be found other channels in between, often belonging to alternate services that share the band. For example the Amateur 70cm band is primarily allocated to military use (mostly RADAR of certain kinds). The steps, and/or bandwidth required even bandwidth may vary. More commonly allocations to broad government entities ("municipal government" for example), may end up being used by numerous agencies that don't all (though usually do) share the same band plan...

I'm curious about documentation of these differences. The references I have usually list frequencies and do not compare them to band plans where such exist (except for the 800Mhz area). Also remember that the 2M area (used by govt. alot above and below the amateur area) is stepped typically at 5khz, so it would be hard to get in between that! My guess is in 10 years or so (with tighter equipment specs), channels may be 2.5khz appart for some uses.

Hey FEV,

Let's not have this dull, boring debate about what the fun is in listening to fast food freqs- haven't you been with the group for awhile? It's been discussed a billion times...

Conclusion: Why did you buy a scanner in the first place? To listen to things other people can't. Nuf said.

soliver@ozarks.sgcl.lib.mo.us

>scanner I know of (other than a modified cellphone) can decode that.

Due to the vast number of analog cell phones out there already, it will
take at least 5 years before any significant turn over to digital phones
occur, even if they were available everywhere right now.

One testiment to slowness of change: there are still cell phones out
there on the old outdated freqs being supported (~153mhz and others).

There is an appeal to having a scanner with no government mandated
blockout, even if the signal is digital and can't be listened to.
Sort of like the disdain people have for buying a car with a speed
limiter on it, even though they will never drive fast enough to hit the
limiter.

Hi Berton! Well, as a happy owner of a Pro 2004 an older 300 channel unit that is now pretty much a 2006 as far as channel and scan rate goes, it does make you wonder. BUT when you think of the Research and Development that goes into these things, it's not suprising that maybe they'd want to do this and after a few years of 2004 sales, introduce the NEW AND IMPROVED 2006! Guessing only, but it would explain how they could get a whole new model with a very small amount of change. No big deal really. Car manufacturers have been doing it for years.

You're right. It probably won't stop with scanners. As the year's progress, it may be harder to tell apart a radio from a computer. The two will be very interconnected, possibly even to the point where a PC, which extremely fast processors coming, will be able to figure out scrambling and/or digital encoding done on a specific frequency, and translate it real time. So digital cellular, may not be as secure as it is now. In any event, watch for restrictions on software, by the govt, which won't admit that laws governing receiving certain over-the-air transmissions (eg. cellular) are just unenforceable. The same will hold true with computers, but the airheads in Congress can't figure out how to tie their shoes, let alone advances in technology.

2083. What's The "World's Best" scanner?

Newsgroup: rec.radio.scanner
Date: 1994-09-11 19:22:26 UTC
From: g9153402@huey.csun.edu
Message-ID: <34vldi$l6h@nic-nac.CSU.net>
Source record: 268994

O.K. What IS the world's best scanner, and what countries can they be purchased, along with costs, specs, and so on?

I mean, I want to know the best. My goal is to find the following features in one handy unit:
1 hz to 3 Ghz coverage. All modes, no gaps.
Can hear everything from submarines, sw, to space aliens.
Super fast, thousands of channels, and all the handy options found on today's expensive scanners.
Able to interface with other devices, can decode scrambled/digital signals.
I want this scanner to do everything, but optional are:
wash windows,
does the laundry,
does the shopping,
and can also cook.
Although that would be nice too.

Votes/Suggestions of which scanner this is, or any new models coming?

motorola makes software for the "advisor" pagers. advisors are
alphanumeric and capable of displaying approximately 80 characters of
text per message. (i've got one, they're pretty neat, but service is
expensive). unfortunately, motorola is pretty strict on not letting
regular customers having the software, and would rather have customers
call the 800# provided to send pages (and charge you up the ass for it
too). my only guess for them not letting the general public have the
software is so they can try to sell the nifty $400 desktop miniature
keyboard & display that would be used by someone like your secretary at
work to send you messages. the only real advantage to having the
software is that you can send vulgar / disgusting messages with it that
the dispatchers at the 800# would normally just hang up on you for! :)

BM> Hi,
BM>
BM> I'm in the same situation as Claude in that I am trying to evaluate
BM> the Bearcat 2500XLT. I have some beginner questions. What is
BM> "intermod"? Can it be compensated for with extra gear? I live about
BM> five miles outside of Boston. Will intermod be a problem? How can I
BM> tell if the model on the shelf is one the the newer ones?

Hi, Bob..."Intermod" (short for the term 'Intermodulation') is the mixing of two signals inside the radio and coming up with reception of a third. This third frequency is usually not the frequency you are trying to listen to and may become mixed with the frequency actually being monitored. Most radios have intermod. Some just resist them better than others.

The units all have a date code on the back of the radio. New units that can be still modified for continuous coverage are 0LIC (meaning 12/93) and were the ones that showed remarkable improvements. Current units are running 0FID or so. It has been reported on CompuServe that these units are no longer capable of modding for continuous 800 Mhz coverage as they have installed the new chip in this one.

The BC 2500 is about to be discontinued to make way for the BC 3000XLT. Not sure what features it will have but has been speculated that service search, (found on the BC220, Pro51 (made by Uniden for RS) Sportcat 150) will be included on this unit.

Find a place that takes returns and take it for a test drive. The features are excellent.

TJH> the base unit from the AC, the handset stays on, listening to its
TJH> current 46MHz frequency and simultaneously transmitting on the
TJH> corresponding 49MHz frequency. I suggested this to a friend of mine
TJH> who was experiencing bad interference on his phone - he said later that
TJH> the offending conversation came in perfectly clear, but he muted his
TJH> handset so as to not interrupt it.
TJH> If this is something that some of you already knew, sorry about the
TJH> bandwidth. It works really great with the 10-channel units.

Hi, Tom...
While your friend can listen, in the majority of cases, your friend
wouldn't be able to break into the conversation. This is because the
cordless phones use a sort of PL tone that ativates the base. This is all
of those fancy dip switches that let you select the code. Some cheap
phones just change the frequency. In any case, unless your friend had the
same exact phone, same exact frequency, and the same PL tone, he wouldn't
interrupt the conversation by using only the handset.

From: shawn4sk1@aol.com
Message-ID: <34vuqs$euc@search01.news.aol.com>
Source record: 269001

I'm sure it's been discussed before so if you think it won't be of much interest to the group, please E-mail me directly.

I'm wondering if it is possible to scramble the cordless phone signal on my phone so the "general" listener can't evesdrop like I do to them (snicker, snicker...).

I realize any scrambler of reasonable availability can be descrambled but I don't think many people around here have the gear to descramble anyway...

What is the cost? Where can I get it? How much? If there are options on the market- if you are educated on the differences, please decribe the options and their relative cost and pros and cons.

Thanks in Advance!

2100. Programming Info for Bearcat 101 ?

Newsgroup: rec.radio.scanner
Date: 1994-09-12 01:12:15 UTC
From: mrb1@cbnewsh.cb.att.com
Message-ID: <CvzsoI.L93@cbnewsh.cb.att.com>
Source record: 269013

Hi:

I would appreciate it if anyone in this newsgroup could help me out with the following:

We have an old Bearcat 101 scanner....this is from the mid-70s, and has the row of 16 toggle switches along the front. In normal operation, each switch selects or deselects the channel (from scanning reception) but the switches are also used in programming the scanner's frequencies.

The unit came with a list of frequencies in MHz and the corresponding "binary" (switch up or down) setting. Unfortunately, the documentation has parted company with the scanner :-)

Is there anyone out there who can 1.) Xerox and mail me the list [postage & costs gladly reimbursed] -or- 2.) tell me the "secret" formula so I can calculate the switch settings I need -or- 3.) reply with the switch settings for the particular frequencies of interest ?

Thank you very much in advance!

SMacken (smacken@aol.com) wrote:
: As a former employee of RS I feel compelled to respond to the considerable
: Abuse that RS employees have been taking in this and other forums about
: the various nets.
: First I must ask you if you remember the 'OLD' slip of paper sales
: procedure that was used ?
: If you do you must also remember the unacceptable amout of time it took to
: complete a sale !

Using a prebious inept sales receipt process in no way justifies
anything. Certainly the "new" system is better, but it is irrelavent
to the asking for name/address/phone number issue.

: Then as now you were perfectly capable of using another name and address
: at any time you wished. Or in most cases NONE even though it was against
: company policy !!

I have no problem being asked for my name/address/phone number for a cash
sale. I won't give it, but I don't mind being asked...once. It has been
my experience in the past, although much less in more recent months,
that haviing said no, the sales person would either insist on the
details or otherwise continue to pester me for the information.
Frankly, once I've said no to the question, the sales person should just
let it be.

: You must also be aware buy now that RS !!DOES NOT!! use the information
: supplied in it's point of sale data base for any purpose other than RS
: needs. This information has never been and i assume never will be sold to
: other data base companies !!

That's not the issue. The fact remains, there is no legal reason,
nor is there any ethical or moral reason for me to give personal
information when I make a cash purchase...regardless of how well
intentioned RS may be with the data.

I just bought a PRO 2006 and by brother has a PRO 46. Thanks to some good info from this news group we are both enjoying them to the max.

My father in law has an old - but still in great condition PRO 2020. It still works perfectly, but of course the frequencies it can recieve are very limited.

Does anyone have any mods for this old box? I'd love to surprise by father in law with them. He got bored with it years ago.

Thanks

Hi Gang:
The Silent Play model number is 270-1715. Get the sales person
to run that number to see if they have any in inventory. I think it's
a discontinued item. But, there are quite a few still around.

Portable phones are already made that scramble. In fact, GTE PhoneMarts
in my area, just placed an ad for one in the local paper today. I think
the price was $98, and the ad stated the fact that unscrambled cordless
phone conversations could be heard possibly by other cordless phones near
where you live, and by scanners. But the scrambling techniques on these
phones (which make you sound something like a mumbling Donald Duck on
a receiver that doesn't unscramble) is rather primitive, and unscramblers
I've heard are available. So I still don't suggest using these phones
for super-secret, personal, or sensitive stuff.

To add to Curtis Wheeler's excelant information about the frequencies used for airliner direction finding, I'd add somethings I learned from an article in _PC Computing_ magazine early last uear. They set out to find out why certain airlines were banning the use of laptops in flight. They wanted to find out just what incidents caused all the concern and hysteria.

They found that there were precious few actual incidents of spurious emmissions that had affected a plane's heading. The most dramatic and best documented one was when a bunch of Razorback fans were flying home to Arkansas while listening to the football game on personal radios. The plane ended up several degrees off course. The interesting thing to remember tho is that there were about 40 radios in the passenger cabin, all tuned to the same radio station. The magazine folks concluded that this was a rare event and that a couple of radios in the cabin are unlikely to have much effect. They went on to test a whole bunch of computers and portible equipment in thier lab and didn't find a whole lot of RF emmissions.

I've had a few responses so far- thanks guys...

I just wanted to be more specific-

I already have a fairly expensive AT&T 10-channel cordless phone- I'm not in the market to buy a new one unless the scrambler is going to cost nearly as much. Besides, the phone I have isn't made anymore and the reception circuitry is alot better than some of my friend's newer ones (and NO, I'm not interested in a debate or discussion about the reception quality of cordless phones... :-)

Also, the amount/severity of scrambling is really not that important to me- I just want the average Joe Blow who doesn't have de-scrambling devices to not be able to comprehend what is being said. If he can, then it probably really isn't much of a scrambler...

Finally, if you're going to post info on this:

1) Please post it to me directly as the group is really set up to discuss scanners. If you want copies of the info I receive b/c you're interested in the subject also, E-mail me w/your address and I'll gladly do it for ya...

2) I'm looking primarily for Manufacturers, Model Names/Numbers, Prices and Vendors- a quick review would be nice also... :-)

I try to post as much to the group as I possibly can/feel is beneficial...
To those that respond: Many Thanks and I hope I can return the favor!

Message-ID: <350ib4$kgh@search01.news.aol.com>
Source record: 269019

Regarding the comments made by people who don't get kicks out of tuning in fast food order windows.....

It's kinda like ham radio. Some of us get into it to talk to everybody on repeaters on 2M. Others like to talk around the world. Others become interested in packet. Others send TV pictures from their hamshacks on UHF and HF. Some send Morse code messages. Some like to do it on microwaves.

The point is there is something for everyone, and scanning is much the same. Some of us like to listen to cops, some of us like to listen to the FCC, some like to tune in plumbers and others like to listen to fast food windows.

That's why scanning is a great hobby. There's always something different to listen to.

Source record: 269022

O.K. - Here goes. I just recently purchased a Pro-43, with no "A"
in the serial number, and a date of manufacture of 10A3.

I have seen some posts here about some modifications that can be
done, but nothing too specific. I would like to get a list of all the
known Pro-43 Mods.

I don't have access to FTP from the Free-Net, so I can't get to
oak.oakland.edu to get the files.

If anyone who has the files for the Pro-43, could they please E-mail
them to me? It would be greatly appreciated.

Thanx. Rob.

Instead of dealing with RS emloyees, who are usially the most technically
illiterate persons, I suggesting you to call Radio Lorenz in Montreal:
(514) 392-9200. These guys could give a good advice about scanners and
similar things. I bought there Yupiteru MVT-7100 and wish the same for
everyone. Additionally you'll save PST (Ontario-specific tax - 8%) of
the price.

P.S. If you wish to have no gaps for sure and reliable unit - go for
MVT-7100 + case for it. You'll spend $200 more but will be satisfied
for a long time. 0.5 - 1650 MHZ with no gaps gives a "piece of mind" :).

Yes, from research completed by Sorek on the Martian colonies, we will soon be able to purchase a carbon-based bioscanner capable of simultaneously monitoring over 100 million frequencies, with a scanning speed limited only by the Subspace Scan Rate Limitation Treaties signed by the United Federation of Planets in the year 2506.

After completing a mind meld with Sorek, I firmly believe that these new units should be available no later than November, 2912. But order early, you know how those nanobots on Saturn are about these things.

Claude, I have had mine for a few months and am nothing but pleased with it. Although, it is a little more succeptable to intermod that I'd like it to be. If you live right in the middle of downtown, you may not be happy with its performance. I've noticed that I can get SJPD _very_ clearly when I'm 10 - 20 miles away, but reception is reduced to _nil_ when I'm in downtown San Jose. But other than the intermod problem (which occures more or less on all scanners) I am 100% pleased with it.

I got mine from Scanner's Unlimited (San Carlos, CA) and hed them perform the cellular modification for it, so that's nice, too. Althoug I really don't listen to cellular as much as I thought I would -- something irritating about only hearing one side of a conversation -- and then have it cut off on you right in the middle (as the driver approaches the next cell).

Yea but does the scanner do all the channels by itself or only
in blocks of 400? To then do more, you've got to flip a switch
or some such trick?

charlie cremer <cremer@delphi.com> wrote:
> dedicated to running the CE-232 interface.

Ok, how about a request for those of us new to the PRO-200x scanners,
is there a comparason of the Commtronics unit vs the Optoscan one?
That Optoscan one sounds like it's gonna cost some bucks.

Do they both require an add in board at the computer or are they
all RS-232 controlled? Can you still use your 200x as a normal
scanner away from the computer, ie. mobile?

Could someone fill me in on something? In the manual for my
2006, they say something like "to extend the life of the
backlight, turn it off when not in use." What's the deal, how
long are these things supposed to last? What burns out on them,
I do belive they're electroluminesence but I didn't think they
had a short life.

I noticed that while watching the NFL game between the Redskins and the Saints on 9-11 that both coaches were using headsets that were connected to walkie-talkie type radios on their belts with antennas. Anyone know the freqs for these radios and how do they keep from listening to the opposing teams info?

80 character Advisor? Mine displays 240...Anyhow, call Compuserve and download Alpha-page, a great Windows based paging program and it's shareware. The registered version has spell check and a few other neat things. It sells for around $120. Also Egghead can special order Notify, which is another great Windows paging program for around $149

>Which make and model Cell Phone is hardest to "inadvertantly" overhear?

You want either a "TDMA" system or a "CDMA" system. Both are so difficult to monitor with a scanner as to be practically monitor-proof. Ask your service provider.

>present when a transmission occurs; this occurs exclusively in the 134 -
>135 mhz am range. this is an internally generated noise and is not
>interference. The problem always clears up after the unit has been on long
>enough, after 45 min or so.

Sounds like an IF or RF stage is breaking into oscillation.
I haven't had that problem on my PRO-200x scanners, but I did
replace an MC1488 op amp IC in the IF of an Icom R-7000 to cure the
problem you describe. Another manifestation of the self oscillation
was that is produced "wandering birdies."

Several years ago, I returned a portable PRO-30 to Radio Shack
because the IF stage broke into oscillation, but it oscillated
regardless of where the radio was tuned.

2129. STATE PATROL FREQS (text)

Newsgroup: rec.radio.scanner
Date: 1994-09-12 13:31:00 UTC
From: sysop@pfzrfsg.com
Message-ID: <29e.2660.21@pfzrfsg.com>
Source record: 268891

The posting regarding State Police Frequencies from tampico@teleport.com
is incorrect for New Jersey.

The New Jersey State Police use a statewide trunked system:

Troop A (South): 855.2125, 855.4625, 855.7125, 856-860.4375, 856-860.9375
Troop B (North): 856-860.4625, 856-860.9625, 866.5625, 867.2375
Troop C (Central): 856-860.7125, 857-860.2125, 867.2125, 867.6625, 868.1375

The assignments are not hard and fast. Some frequencies are used as overflow
for other troops and the system is reconfigured from time to time.

Internet E-Mail: sysop@pfzrfsg.com (System Supervisor)

My 7 year old '2004's backlight flickers intermittantly. I cant force it
by tapping on the case or jiggling anything. It happens in both bright and
dim modes. Maybe it isn't so long lasting. This scanner spent a year without
ever being turned off.

You might check out the new 900 Mhz. cordless phones.
I have seen some of them advertised as "spread spectrum" which
should give some scrambling function.
Take a portable scanner to a store and try their phones & scope it out.
They are expensive though. The ones I have seen are ~~ $300.
Personally, I use 25 foot cords on all my handsets.

|> 155.475 - National Law Enforcement

While I've never heard xmissions on this freq before either,
I anticipate it will only be used when an interagency coordination
is required across state (or commonwealth) lines. In Middlesex
County, NJ, for instance, the level of interagency coordination
proceeds like this:

If an emergency occurs that involves two or more agencies within
Middlesex County, they communicate on 453.475, which is sometimes
called the "hotline" or the "red phone". Then, if the emergency
either escalates to, or initially involves an agency within the
county and one or more outside the county, the communication moves
to SPEN 1, the Statewide Police Intersystem Network, 154.680. All
agencies in the state can transmit on this freq. Initial comms
on this freq are usually opened by "<name of town> to all surrounding
towns on SPEN..".

I assume that if a chase (which is all I usually hear on SPEN in
my neck of the woods) proceeds across state lines, that's when
the NLEEF will come in handy. I've also heard that agencies can
coordinate with Federal authorities on this freq. Recently, Newark NJ
cops had to respond to a federal agent in need of urgent backup,
and I still didn't hear anything on NLEEF.

I wouldn't expect too much to be heard here unless you live near
a state border or there is a big time emergency. Don't waste
a channel if you haven't any to spare. Same probably goes for
Red Cross. Unless you drive into hurricane-struck shore
communities often.

I read an ad featuring the AOR1500 and the AOR AR1000 XLT
and was rather impressed with the continuous frequency range
from 0.5MHz to 1300MHz, which includes shortwave.

Are these two scanners built to receive shortwave signals,
even the weak ones? Or is shortwave reception weak?

2145. BC2500XLT Keyboard Mods...

Newsgroup: rec.radio.scanner
Date: 1994-09-12 18:07:39 UTC
From: domonkos@access.digex.net
Message-ID: <tT9TkiubGwVH066yn@access.digex.net>
Source record: 268915

I understand that Uniden manufactured scanners (like 200XLT, Pro-51) have test freq's that are enabled when a keyboard sequence is performed. Has anyone tried these with the 2500XLT? I know there is no direct search feature w/the 2500 but if it's VFO tuning is similar to the 890XLT then once the test freq. is in memory (8XX.XXX Mhz) etc, the VFO tuning (and/or up down buttons) may be able to step thru these ranges. I'd appreciate any results if anyone has tried this. Thanks.

Andy

>A couple of years ago Radio Shack started a campaign to update their
>mailing lists by asking for your name and address on even cash sales.
>This little pitch starts off with, "May I have the last four numbers
>of your phone number?"

Let's do something like this: everyone on the net, if you have to buy something at RS, use the same number as everyone else. Let's say, the number is "7448". Give the last name "Head". Make up any address you want. This will only have to be done once per store, for the next one of us who goes in there, giving the magic number "7448", then they say "Last name?" and you say "Head", and it's already in there, and you don't have to do anything else, such as waste time arguing about whether or not you have to give it to them, etc.

If the number is already in the machine, then you know one of us was there before you.

Eventually the more astute salesdroids will realize that you are calling him a 7448-head (look on your phone for translation) and probably won't pester you for the real number.

The units all have a date code on the back of the radio. New units that can be still modified for continuous coverage are 0LIC (meaning 12/93) and were the ones that showed remarkable improvements. Current units are running 0FID or so. It has been reported on CompuServe that these units are no longer capable of modding for continuous 800 Mhz coverage as they have installed the new chip in this one.

My unit is marked as 0FIC. The dealer reported that this unit was modifiable. Is this accurate, and does this unit 'show remarkable' improvements?

The BC 2500 is about to be discontinued to make way for the BC 3000XLT. Not sure what features it will have but has been speculated that service search, (found on the BC220, Pro51 (made by Uniden for RS) Sportcat 150) will be included on this unit.

I am not familiar with the 'service search' feature. What does it do?

SMacken (smacken@aol.com) wrote:
: As a former employee of RS I feel compelled to respond to the considerable
: Abuse that RS employees have been taking in this and other forums about
: the various nets.
: First I must ask you if you remember the 'OLD' slip of paper sales
: procedure that was used ?
: If you do you must also remember the unacceptable amout of time it took to
: complete a sale !

This wasn't because of the slip of paper. I could usually get in and out of Telrad electronics, a local parts/tv service supply chain, in about half the time of a RS transaction, and *they* used paper. The problem was that RS insisted on collecting too much information that had to be *written down* on the slip of paper.

: Then as now you were perfectly capable of using another name and address
: at any time you wished. Or in most cases NONE even though it was against
: company policy !!

Perhaps RS company policy should be more oriented to serving the customer's needs than to serving RS's needs.

: You must also be aware buy now that RS !!DOES NOT!! use the information
: supplied in it's point of sale data base for any purpose other than RS
: needs. This information has never been and i assume never will be sold to
: other data base companies !!

I take it you are in a position to guarantee this "good behavior" on RS's part for all time? Interesting.

Well, the latest and greatest is supposed to be the AOR AR8000.
DC to Daylight, no gaps, 1000 channels, and about 600 dollars.
Currently europe only, but can be US with no 800 band? Not sure.

>Well, I've thought about this for a couple days now and still haven't found
>any good reason why anyone would want to listen to McDonalds frequencies...
>Please excuse my ignorance if I am missing an obvious one, Anyone wanna clue
>me in? 8-)

Try it. You can hear some pretty innnnteresting things from time to time. Topics can include
the girl at the window's impression of your car, why your fries are taking so long, etc.

I would reccommend the weekends; it's invariably more fun when the teeny-boppers are running the
show. (Specially if the other wired ones are their friends....)

One day if anyone is interested I'll relate the story of when one kid insulted my friend (behind his
back, or ears, as it were) and what happened.. Funny story.

> I just run a cord from the headphone jack on my scanner to teh CD/AUX input
> on the car radio. Works great.

Gosh, Glen, what an original and creative idea!

What will you do for an encore?

Oh, I know -- you'll suggest getting a cigar lighter power adapter for the scanner, so it won't have to run on its internal batteries while it's in the car...

(Dear heart, the vast majority of car head units, including some very good ones, *don't have* CD/AUX inputs.)

I should have mentioned that I live 1/2 mile from a megawatt FM broadcast
transmitter. It tends to de-sensitize recievers in my house.

154.22 is the metro fire VHF frequency. All transmissions on this
frequency are retransmitted on 483.1625.
During a fire of several alarms or more in the metro boston area..
ie south to weymouth
north to peabody
and west to natick
you will hear lots of activity on this freq.

154.22/483.3125 test every night at 8 and every morning at 10
on saturday they test all the apparatus as well.

153.965 I have heard activity on the mcad freq. Coming out of framingham.
But it is rare. Only during the big ones is it really active.

47.66 this frequency has an interesting history.
Way back it was used by the Red Cross a lot out of the Newton office among
others.
Then Chalk ambulance started dispatching there too !!
Chalk was so busy all the time that the Red cross essentially abandoned
the freq. The base station is still there in newton but is older than i am
!!!!
Well now Chalk has switched over to 800 mhz.
so I guess you could say that this freq has been pretty much abandoned.
but give it a listed during the big one !! the mobiles still have it as an
option.

have fun

Source record: 268920

You are hearing the middleton police frequency of 471.6125
which is their assigned frequency.
The AM signal is du to the fact that you are way off the center frequency
and into the signals sideband.
Normally the radio will not respond to the sidebands because the signal
level is so low. I assume you are in or very near the transmitter.

> 155.475 - National Law Enforcement
> 154.22 - Mass Metro Fire
> 153.965 - Civil Defense
> 47.66 - Red Cross

Don't know about the fire freq., but the others wouldn't normally be very active unless there was an emergency or situation which would call for their use. For example, the National Law Enforcement is shared by P.D.'s across the country and could be used by a P.D. in one state to communicate with a P.D. in another state in a situation where that was necessary. Under normal circumstances, departments would have no reason to use it.

NOTE: Please do not call my daytime office phone nor send me
e-mail about RadioMap.

RadioMap - Custom Color Maps
of Transmitter Sites in IL, IN, WI, MI, and NY

by Bob Parnass, AJ9S

As a radio hobbyist, I've spent a lot of time trying to
identify the radio antennas and antenna towers I see in my
travels around the Midwest. An FCC license database is
useful but transmitter site information is often vague or
incorrect.

To help identify antenna towers, I invented a computer based
process which uses a combination of FCC and other databases
to create a color map, a RadioMap, showing transmitter sites
within a given area. After drawing my first RadioMap, I was
able to identify a neighborhood microwave tower which had
been a mystery since I first saw it in 1985. The
transmitter latitude and longitude information filed with
the FCC was correct, but the transmitter city was mistakenly
listed in the wrong city, in an adjacent county!

There are no streets, rivers, or ham radio stations shown on
a RadioMap, as they would clutter the map. Instead, there
are police, fire, cellular phone cell sites, paging
transmitters, state and local governments, businesses,
factories, etc. -- from VLF through microwave frequencies.
Fixed station locations are marked on the map, and callsign,
frequency, and licensee name are listed on a key page.

Choose the center location, and for $17, I will create your
color, custom RadioMap. At this time, I can make maps only
for locations in:

Illinois, Indiana, Michigan, New York, and Wisconsin

You can find transmitter sites in your neighborhood, near
your office, around airports, sports stadiums, or anywhere
else within these 5 states. These color maps look
professional and can be laminated or framed. (A RadioMap of
my community hangs in an oak frame in my office).

Map coverage area will be adjusted for best readability. A
range of 1 - 2 miles works best in areas with a lot of

transmitters. For example, using RadioMap, I found there are over 6,800 transmitter sites within a 2 mile radius of the Loop in downtown Chicago! In rural areas, RadioMaps with a 5 mile range or greater are often possible.

To get a color, custom RadioMap, send:

1. Check for $17, payable to Bob Parnass. Personal checks subject to 2 week delay until your check clears.

2. The center location for your RadioMap, preferably latitude and longitude, down to the nearest one second, e.g., 41 41 15 North latitude, 88 18 33 West longitude. If you don't know the latitude and longitude, specify the city, and nearest street intersection, e.g., intersection of Ogden Avenue and Mill Street in Naperville, Illinois.

3. Your evening telephone number so I can call you if I cannot read your handwriting or have other questions about making your custom map.

Bob Parnass, 2350 Douglas Road, Oswego, Illinois 60543-9794
Evening telephone (708)554-3839. No calls after 10 PM Central Time, please.

September 4, 1994. Price and terms subject to change without notice.

2172. Bearcat BC-120?

Newsgroup: rec.radio.scanner
Date: 1994-09-12 23:09:56 UTC
From: russell@gonix.com
Message-ID: <russell.779411396@gonix>
Source record: 268840

I noticed that Damark has a Unidec BC-120 for sale in the latest catalog for $169.95. I've been thinking about "upgrading" my BC-200XLT to a Sportcat, because it scans faster, is smaller, and I don't ever come anywhere near using all 200 channels in my 200.

The 120 looks to be pretty much exactly the same as the Sportcat, but without the direct-access buttons and WITH the number keys in the proper orientation, not in a row like on the Sportcat, which is the one thing that looks annoying about it.

So, does anyone have impressions of the 120? I'm not interested in cellular coverage at all, I have a Kenwood HT that handles that just fine on the rare occasions that I'm interested.

Please email and I'll summarize. Also, if anyone is interested in a slightly used, cellular modifiable BC200 with carry case, batteries that haven't been recharged much at all, the original duck and a Radio Shack scanner whip, for say, $165 + shipping, let me know.

Tim Russell, russell@gonix.com

2173. Looking for PENNSYLVANIA info

Newsgroup: rec.radio.scanner

Hello Pennsylvania scanner folks:

I am looking for detailed scanner information for the following areas in Pennsylvania:

Erie
Scranton / Wilkes-Barre (including Poconos)
Johnstown-Altoona
Pittsburgh / Allegheny County
Harrisburg
Williamsport

In addition to frequency information and channel assignments, I also am looking for unit numbering lists, station lists, radio codes, etc.

Also trying to locate a NEW Pennsylvania State Police channelization plan or map showing which barracks is using which frequency in the new radio system scheme.

Can anyone help with this? Feel free to e-mail me at scan911@aol.com.

Thanks!

Chuck Gysi

2174. Cellular Assault Scanner (DDI/D)

Newsgroup: rec.radio.scanner
Date: 1994-09-13 00:54:29 UTC
From: basham@hpcc01.corp.hp.com
Message-ID: <71960011@hpcc01.corp.hp.com>
Source record: 268843

OK, now that I have your attention...

Are you tired of listening to cellular conversations only to have the call handed off to the next cell just as the conversation gets juicy? Would you like a way of hearing only the best cellular calls and tuning out those annoying marital disputes? Would you like to log to tape the calls from your favorite cellular phones? Would you like to see the cellular phone number that is making a call while you listen to their conversation? Don't miss this opportunity to buy a fully automatic cellular assault scanner!

Start with one of the hottest receivers around (Icom R-7000), including:

- Infared remote control (couch potato heaven)
- Video receiver (pick up 900MHz video, etc.)
- 100 channel magazine^H^H^H^H^H^H^Hemory (no possible sporting purpose)
- AM, FM (Narrow, Wide, and Cellular data filters installed), SSB, NTSC..
- 12 VDC power option installed.

Then add the selective fire attachment:

- DDI/D control system (Digital Data Interpreter)
- Decodes forward and reverse digital data (does NOT decode ESNs)
- Decodes DTMF (and logs to disk for future reference)
- Cable harness for R7000
- Cable to PC serial port
- Rev. 4.2 software

Allows for logging of all calls or selected mobile numbers to tape.
(remote jack plugs into tape remote control to start/stop recorder)
Turns monitor speaker on when voice is present on call.
Decodes and logs to disk mobile number, cellular channels used,
DTMF sequences sent, power change instructions, etc. Really
useful for locating white Broncos!

Follows channel change instructions so no gaps appear in conversation

Displays mobile number when call begins

Currently, it is still legal to possess such equipment. If we get another silly bill through the white house before this silly Bill is voted out, ownership may be illegal. The usage of this equipment probably would violate several laws, statutes, etc. Consult your attorney before using it.

I assume no liability whatsoever for what you do with this equipment. I strongly encourage you to use it outside of the United States, where your freedom is not restricted (try Canada).

Why am I selling it? I'd much rather own a Politically Correct HP 8920 RF communications test set. I'll accept the highest offer over $1600 for the package. You will need to provide a PC to run it with.

Email to basham@hpcc01.corp.hp.com for info / highest offer.

2176. Monmouth County NJ Frequencies ?

Newsgroup: rec.radio.scanner
Date: 1994-09-13 01:32:04 UTC
From: mrb1@cbnewsh.cb.att.com
Message-ID: <Cw1o9n.GFD@cbnewsh.cb.att.com>
Source record: 268906

Hi:

I am posting this with a distribution of 'nj', so if it propagates outside of the New Jersey area --- well, sorry, I tried :-)

Now that a kind soul has helped me out with the programming technique for our trusty Bearcat 101 scanner, I would like to set it up for my mother in her apartment to provide some listening enjoyment.

What I'm looking for are suggestions of "good" frequencies in the Ocean Twp area of Monmouth County, NJ (near Seaview Square, rts 66 & 33 & 18 & GSP, maybe a marine channel or two, etc.)

No paging freqs or McDonalds headsets but frequencies interesting to the civilian layman type of casual observer. The scanner has *16* channels so not a lot of room to play with compared to more contemporary units.

By the way, the apartment is on an upper floor of the building with quite a view (to the north / northeast) so feel free to suggest some "DX" too.

Thanks in advance for helping me out with this.

Maurice Baker
WA3ZXO
AT&T Bell Labs, Holmdel
mrbaker at attmail.com

P.S. -- I don't have a frequency list or chart of any sort, so even the obvious choices are welcome!

I want to fill up an entire channel bank in my scanner, with all 40 CB frequencies. The problem is, I don't know what they exactly are. I checked the instructions on an old CB I have, and all it says is that it broadcasts on CB channels 1 through 40. That doesn't do me any good.

I do think the frequencies are somewhere between 25 & 29 mhz, and are AM, but anyone have the exact numbers? Thanks.

if you live in california, and better yet, in the bay area, i'd reccommend the Government Radio Systems Guide by Bob Kelty. it's an excellent choice, for the person more interested in system information and operation over licensing information (few callsigns given). very complete listings including repeater inputs (even nonstandard ones) and CTCSS/DPL/burst tone frequencies/codes. even some secret service/fbi/government stuff in the back for those interested in those ares of monitoring. very complete for what the name says, government. listing is by county/region. available in hard copy or on disk. the statewide version hasn't been updated since 1990, but is still quite complete, while the bay area version (san francisco bay area), was recently updated in 1993, and is quite accurate. not much else for the bay area is more complete.

Sherwin, as a news journalist, you should become familiar with the Communications Act of 1934. It spells out that what you overhear on the airwaves (except broadcast radio and hams and another cannot be used for financial gain (publication of a newspaper would be included here).

I am a former news editor (and reporter) and I never let a reporter quote over-the-air
traffic. They had to get information from the emergency services before we could publish anything.

After reading various articles in this group I get the impression that people think that Digital & Encryption are the way to go to ensure your privacy.

Once digital becomes more popular, how long do you think it would take an enterprising Scanner manufacturer to manufacture a GSM or DAMPS capable scanner !!!!.

Should'nt be to long. I'm sure there are millions of $$$$$ to be made in this area. The signaling protocols etc are not proprietry infomation and are quite readily available to those who wish to look. They have to be as all the manufacturers have to make compatible equipment.

I bet there's some enterprising Uni Student making one of these devices as part of the Phd as we speek.

As for Encryption, it is more trouble than its worth. In order for encryption do be effective the key (code) must be secret. How do you have a secret key and still maintain the ability to dial whoever you like. Encryption is Fine as long as you only want to talk to a limited number of people with whom you share your key.

Anyway thats my two cents worth.

2193. Misplaced FUNC key on AR8000!?

Newsgroup: rec.radio.scanner
Date: 1994-09-13 09:11:52 UTC
From: torbjar@cdg.chalmers.se
Message-ID: <TORBJAR.94Sep13111153@wilfer5.cdg.chalmers.se>
Source record: 268865

Looking at a color picture of an AR8000 with LCD and keys lit, I see that the FUNC key is placed on the left edge together with MONI, LAMP and K.LOCK. This seems to be a bad design and means that the unit must be awkward to operate (with one hand) when it's not handheld (e.g., in a car or in front of you on a desk). Let's hope that the FUNC key doesn't work like a SHIFT key, so that you must hold it down while pushing the other key!

Nonetheless, it's an interesting step in scanner UI design. What I would like to see next is a redesign of the traditional, separate scan and search, fixed bank memory organization. Remove the distinction between scan and search banks. Introduce variable-size "banks", which are lists of some memory element. Each element may contain a single frequency (scan), a pair of frequencies (search), another list (or possibly something else). Thus, I can search several frequency ranges and scan a mix of frequencies and frequency ranges, and I can create lists for different locations (and occasions) by simply (well :-) using existing lists.

To create a UI to control this and provide an overview of the allocations in the restricted (display) space of an ordinary handheld scanner is probably a challenge. But I would prefer better functionality (and performance) to further miniaturization.

Yupiteru, are you listening?

I Have a 1000XLT and hooked upa SW antenna. The upshot is that if you're really interested in listening to SW, get an SW receiver.

Try using Radio Shack extra capacity batteries. I picked up a set this weekend and the extra buck was worth it. My Pro43 lasts a great deal longer with these batteries in between charges.

Well Steve, how do you define very near? I'm in Danvers when I
hear this, the next town over, inside of a very noisy building
and the transmissions I've heard are very clear. I'm a good 2-3
miles away from the edge of Middleton.

Errr...mmmmm....yes/no, yes

The AR1000XLT does not have a BFO/SSB capability. It's smallest
tuning step is 5KHz. Originally the set was designed to operate
15Mhz+ but over a period of time the CPU "bottom" limit was
brought down to 500KHz but with no real consideration for the RF
sections of the radio so performance on the SW bands is not too
good at all. You will find it worls on strong AM signals but thats
about it.

The AR1500 is essentially a AR1000XLT cramed into a smaller "box"
and then fitted with a manual BFO for SSB receiption. It will
still only tune in 5KHz steps so is far from ideal for HF use. AM
performance is again pretty poor.

I assume you are referring to unencrypted narrow-band FM transmissions
on VHF/UHF. In that case, there is no "reasonable expectation of
privacy" (at least there shouldn't be) for that mode of communication.

I would think you could publish what you heard. But then I'm no
lawyer (and proud not to be one ;-) .

Achtung! Achtung!

Announcing Issue 6 of ENIGMA
============================

ENIGMA is the newsletter of the European Numbers Information Group and
Monitoring Association and is essential reading for anyone interested in
the spy numbers stations ever present on shortwave radio today. Although
European-based, we have many monitors throughout the world.

Issue 6 is packed with news and features about the numbers station scene
(both Voice and Morse) including:

* 10 pages of up-to-date station news
* Latest transmission schedules and site news
* Latest frequency information including;

Lincolnshire Poacher, Ready Ready, Nancy Adam Susan,
NNN, CIA Counting Stations, MOSSAD Phonetic Alphabet,
German Two Letter, Three Note Oddity, Swedish Rhapsody,
Bulgarian Betty and Morse Numbers Stations

* Detailed Station Features on:

- "The Russian and English Man"
- "The Phonetic Alphabet Station - EZI"
- "The Counting Stations"
- Simon Mason on "Hitches and Glitches"

* Things that go Buzz in the Night
* A Postcard from Greece
* Spying by Numbers

* ENIGMA Bookshelf reviews Ferrell's Confidential Frequency List

Issue 6 includes Part 2 of our special "Morse Supplement" which covers
those numbers stations transmitting in Morse Code rather than voice.

The ENIGMA Newsletter can be obtained from:

ENIGMA
c/o Bradford Resource Centre
31 Manor Row
Bradford
West Yorkshire
BD1 4PS
United Kingdom.

The Newsletter is available for 2 Pounds Sterling (a single copy) or for
10 Pounds Sterling (a year's subscription - 4 issues).

Numbers on the World Wide Web
++++++++++++++++++++++++++++

For those of you with access to the World Wide Web, take a look at
The Shortwave / Radio Catalog (issue #9) at URL:

http://itre.uncecs.edu/radio/

where you can find information about Numbers Stations and ENIGMA.

Don't worry if you don't have access to the World Wide Web. If you have
access to electronic mail, send a message to "listproc@www0.cern.ch" with
the word "help" in the body of the message. You will be sent a message
explaining how you can use a special server to mail you pages from the
World Wide Web via e-mail.

Sorry, but ENIGMA is not yet available in electronic form.

Ende!
Ende!

[Please note that ENIGMA has no connection with Praxis plc].

No, when the signal is correctly despread, a large gain is seen
in the signal. With knowledge of the signal before spreading, you can
definitly design/build a detector to signal correct despreading.

That is why you use some form of public key encryption. Each phone
has both a public and private key. Everyone knows the public key but only
the receiver knows the private key. Encrypt the message with the public
key and you have a secure message without having to exchange a sensitive
key. The receiver then decrypts the message with the private key.
Get the RSA FAQ from sci.crypt or alt.security.pgp for more info.

>you like. Encryption is Fine as long as you only want to talk to
>a limited number of people with whom you share your key.

You don't need encryption to the people you call -- only to the cell node.
Consider the following scheme:

1. My phone comes on line and contacts the closest cell node with my ESN.
2. Local cell looks up the public key corresponding to my ESN.
3. Local cell picks a random session key and sends it to me encrypted
with my public key.
4. I decrypt the session key with my private key and send back some
form of encrypted acknowledgement.

This keeps the radio link secure without requiring any extra hardware for the folks I'm calling. Using a public key system also allows the CelTel company to build in a secure challenge protocol so that my phone cannot be cloned without physical access to the phone.

I think there is an error here with channel CB ch23 as you
posted. I've been out of CB for awhile but I'll check with the
listing in BEYOND POLICE CALL. The reason I think there is an
error is that there are 6 channels on the 27 mhz band for RC use.
As a race administrator I enter them into the computer thousands
of times. The frequencies you listed above are correct and are
referred in RC as 1 through 5. Channel 6 is 27.255 which the
chart you posted has for 23. I don't think they are used for
both purposes. I know I haven't had any problems using 27.255.

>avionics with sufficient energy to cause interference.

From personal experience, I know that scanners _can_ radiate quite a bit.
This will happen when the antenna goes directly into the first mixer and
the LO injection level is fairly high. Leakage between the LO and input ports
(usually two gates of a MOSFET) causes a portion of the LO signal to travel back
up the antenna and out into space. This signal will be offset from the
frequency the scanner is tuned to by an amount equal to the first IF frequency.

While monitoring my local ham repeater on 145.27, I sometimes hear a periodic
pulsing sound. After travelling through the areas where it occurs, I can almost
always spot a house with an exterior scanner antenna or a police or fire
station nearby. Even the police cruisers cause this effect. It's detectable
with no trouble for a hundred yards or so from the antenna.

I'll check and see if i can find out where the repeater site is for middleton.

I am however not at all supprised to hear your description of hearing the am component of this fm signal when that far from the center frequency.

Don't be alarmed by it.

There is nothing wrong with your scanner...
... we control the dynamic range
... we control the adjacent channel rejection..

bzzzz

see ya

I recently downloaded a really small really simple program that lets you
access the soundblaster from Qbasic V1.0
It is beyond easy to make a frequency counter out of it, and thats all you
need to decode DTMS signals. Also, if you don't have a soundblaster, you can
make a really simple amplifier that brings the audio up to 3 volts, then put it
directly into your parallel port. Using the "inp" function access the parallel
port(I think it's 3BC or 988 decimal) and use that as a frequency counter.
I have used it to record and sample infared signals, audio wouldn't be hard.
If ya need help E-mail me and I'll send the code to you.

I'm getting ready to buy a new base scanner. I seriously thinking about the new Pro-2036 with a list price of $319.00. I know it's not modifiable but that's not real important to me because my Pro-46 gets everything I need ;-) I'm wondering though, the 2036 uses double conversion technology, would I do better getting something with triple conversion? Should I pay list? I'm also told that there still might be some 2006's avaiable out there? Any better equipment for the price? Any and all comments welcome and encouraged!!!!Please!!!!!
I'm buying this weekend <fingers crossed>

HARRIS

May 26, 1993

Mr. Glen L. Roberts Editor/Publisher Full Disclosure Box 903 - FD24
Libertyville, Illinois 60048

Dear Mr. Roberts:

Your issue No. 24 of Full Disclosure has been brought to my attention because of an apparently unauthorized advertisement on page 8 for a Harris law enforcement product referred to as "Triggerfish." It is my understanding that the publication of this advertisement was not previously requested nor authorized by Harris. The unapproved use of this advertisement constitutes a deceptive trade practice, which would potentially subject you and your newspaper to civil liability. Further, you have used our trademarks -- Harris and Triggerfish -- without permission.

Lastly, you may have committed a felony under 18 USC 2512(1)(c)(i). This criminal statute prohibits the placement in a newspaper or magazine of an advertisement for an electronic product that is primarily useful for the purpose of surreptitiously intercepting electronic communications. Further, these actions on your part may have also subjected Harris Corporation to such liability under this statute.

You are hereby instructed to immediately desist from placing advertisements or promotional material related to Harris electronic law enforcement products in your newspaper. Any further actions of this nature will be dealt with by filing a suit against you and your newspaper.

Sincerely, /s/ John L. DeAngelis, Intellectual Property and Licensing Counsel.

JLD/bea

Harris Corporation Electronic Systems Section P.O. Box 37, Melbourne, Florida 32902 Telephone 407-727-4000

Tel: (310) 364-3444 * Fax: (310) 858-7458

Tuesday, June 1, 1993

John L. DeAngelis Jr., Esq. Harris Corp. P.O. Box 37 Melbourne, FL 32902

Dear Mr. DeAndelis:

I write on behalf of Glen L. Roberts, the editor and publisher of the magazine, Full Disclosure, in reply to your May 26 letter addressed to him. In addition to advising Mr. Roberts, I serve as privacy law columnist for his publication and co-host with him of "Full Disclosure Live," a one-hour live radio program carried across the country on the Let's Talk Radio Network.

It is shocking sophistry on your part to have characterized Full Disclosure's editorial expression about the product, "Triggerfish," as an "advertisement" Of course, I recognize your procrustean need to do that, because "advertisement," is the operative word of the criminal statute you cite.

Had you taken time to research even a few of the many cases in which "advertisement" not only has been defined as the space one associated with a product purchases from a publisher, but as well distinguished from editorial expression or news reporting by such a publisher or his or her subaltern, for example, an editor, you might have saved your company the embarrassment that well may flow from your misguided missive. Cary Grant couldn't make an Esquire magazine news article, which used a photograph of his head, into an advertisement in the Southern District of New York 20 years ago; I doubt you'll have any greater success today, venue notwithstanding.

Respecting your assertion of trademark use without permission, we are unable to locate any authority, statutory or decisional, that even suggests that editorial mention of a product or service, which enjoys registered or common law trade or service mark protection, obliges the publisher to include an indication of such status or forbids such publication "without permission." Perhaps, given your stated role as intellectual property counsel, you can afford us the benefit of your expertise in this realm.

What I find most troubling about your letter is your apparent indifference to First Amendment law. A careful reading of the 1968 legislative history of 18 USC 2512 acquaints one with the fact that Congress did not seek to abridge free press rights in proscribing the advertising of "bugging" devices.

Indeed, the intention was to "strik[e] at all aspects of the problem" of invasion of privacy, because "[a]ll too often ... [it] ... will go unknown." It continues to be Mr. Robert's persistent and pervasive theme that for our democratic society to defeat the depredations of privacy-invasive devices, it must know that they exist and how they work.

Hence, attempts like yours to chill or impair free exercise of expression in the arena of such public affairs can only be viewed as inimical to the legislative underpinnings of the statute involved. You use of it is akin to the drunkard's fondness for the lamppost: more for support than illumination. Really, sir, for a lawyer to tell a reporter that there's potential criminality involved in writing about a product in the marketplace should make you tremble to know that God is just.

The First Amendment, you seem to require reminding, is an absolute bar to the imposition of such government restraints of the press as you erroneously

think your cited statute imports. The press must be free to publish news, whatever the source, without censorship. Guarding little secrets, like the existence of your "Triggerfish," at the expense of an informed representative government is about as tawdry a legal proposition as I can imagine.

Let me add that your menacing Full Disclosure's editor with the prospect of criminal charges, in our opinion, implicates issues of professional responsibility. When lawyers in jurisdictions with which I am familiar try that technique to obtain an advantage in a civil dispute, they are subject to discipline. Is there no such sanction for Pennsylvania practitioners?

I invite your reply on the points raised, including your proposal as to how we might avoid formal proceedings to right the wrong you have done Full Disclosure. Failing your willingness to apologize or submit this matter to an alternative dispute resolution mechanism for a declaration of rights, I shall advise Full Disclosure to proceed with an action under 28 USC 2201 as a possible predicate to seeking further relief.

As a matter of professional courtesy, I wish to inform you that the Harris Corp. officers and directors shown as recipients of copies of this letter and its enclosure are not being sent a copy of your letter to Mr. Roberts; it, I believe, more appropriately should reach them from you. For your further information, the two other copy recipients in addition to Mr. Roberts, namely, Messrs.. Ward and Rudnick, are, respectively, our intellectual property adviser and our litigation counsel. You doubtless know Mr. Ward from his prominence at the trademark bar. Mr. Rudnick, who would handle a Rule 57 matter, if such proves necessary, is a former federal prosecutor with the Los Angeles Strike Force.

Sincerely, /s/ Will Dwyer II

There is a specific federal law that transmissions heard
over the airwaves not intended for the general public are
not to be shared by persons intercepting them.

If this were a case of selective enforcement, I could see
idle chatter not being a problem, but putting the content
in print is a different story I'm sure. Of course, high
school newspapers don't have any pecuniary interests resulting
from distribution, right?

I'd say, print it.

Huh? I thought DTMF stood for Dual Tone Multi-Frequency. How does one
use a frequency counter to decode MULTI frequency signals?

I am definitely interested. I have often wanted to decode DTMF from my
scanner. But I am a little skeptical about this method.

2229. BC200XLT died :(Please Help

Newsgroup: rec.radio.scanner
Date: 1994-09-13 20:24:19 UTC
From: todd@shell.portal.com
Message-ID: <3551pj$6h1@news1.shell>
Source record: 268785

I recently turned on my 200XLT after a while on inactivity and was confronted with a brief flash of the display, where I noted the low battery icon was on. Then the scanner went dead. No problem I said to myself, just plug it in to recharge. Well, since that time, the scanner has not returned to normal, even with the battery pack fully charged.

It now turns on and start scanning, but several thing are not working. The backlight does not function at all, no sound comes from the speaker (no click when it is turned on or even the normal background hiss, squelched or not). Even though it is "scanning" the receiver is completely dead (won't stop on a known busy channel) and opening up the squelch also does not stop scanning.

I can enter frequencies which are retained, press the weather scan (which does scan the correct set of channels for NOAA weather but doesn't "hear" them) and use the channel/bank lockout function. Pressing "manual" also works proplerly, with the "dead" receiver still a problem though.

It sounds like the processor got into a "funny" state, since some front panel features work and others do not. I tried the 2,9, MANUAL trick which loaded the test frequencies into memory, but it didn't clear any of the problems. Does this sequence actually reset the processor?? Is there some other reset mechanism I can try?

The only mods done are the cellular mod, which was performed at least 3 years ago. The low battery mod has not been done. Any help would be appreciated.

I've posted a few times on this and I'll do it again. By far, the best books on the market (if you are lucky enough to be in an area that they cover) are the Scanner Master series. Each municipality is highlighted with general information and points out key frequencies in addition to the frequency sorts. This is a must have! The series is published by Scanner Master of Natick, MA and distributed by You-Do-It Electronics of Needham, MA (shich I believe has an 800 number). The Mass. book retails at $29.95; I bought it at You-Do-It with an additional 20% discount. Believe me, the time you will save is well worth the few extra bucks. I think they have books for NY Metro area, DC, and a few others. Take the time to check it out!

Message-ID: <arctic.779494441@access3>
Source record: 268791

Just went in and purchased a pro 39 - it's on sale for $219. I almost had the saleman conned into giving me a pro 43, but the new manager checked, and his cost is $246 :)! (that ought to give us some idea of how to dicker!).

The manager and I bs'd for a while, and he told me about several new models that he had to pull. Some ECPA problem, and if ANYONE sold one they were fired.

The old ones are still available. Plenty of 43's and 39's. Quick questions for everbody:

-Is the 43 worth the extra $80, or is the 39 a good deal? The case and buttons, and connectors line up perfectly, and the specs are very close. Methinks they may be the same rig.

-This one doesn't have an "A" on the serial number. When I restore the 800-900 Mhz bands, do I also get 30Khz steps (like on my 2005?).

-How much should I ask for my R7000?
Now, if only it did WFM (like the '2005), I'd be able to listen to Gordon Liddy and crew too!

Thanks, Rick WB9TSO.

>One testiment to slowness of change: there are still cell phones out
>there on the old outdated freqs being supported (~153mhz and others).

One of the slow downs in the deployment of digital cell phone technology is the type of digital service that is offered. The digital service being offered today is TDMA technology. There are a couple of carriers (one being a major player - GTE Mobilnet) that are not offering digital just yet because they are going to deploy CDMA - and it's not quite ready.

Analog cellular (AMPS) will be around for long time. Primarily because this is the system that phones will revert to if they are incompatable or or unable to operate with a digital system they are using. This is mainly a roaming issue.

As far as outdated freqs go... Mobile phones in the 155 MHz area are not cellular. They are convential full duplex two ways. Usually refered to as MTS or IMTS. These systems are still in use by people that need phone service where cellular is not availble. I have installed (though it's been a few years) Motorola convertable phones that support IMTS and cellular. These phones consisted of two separate transcievers in the trunk - one for IMTS and one for cellular. One handset at the front seat controlled both phone systems.

Right now digital cellular is joke. I think in the bay area there are five digital cell sites on the C-One system (out of a couple of hundred). Yet they advertise a superior digital network (someone from C-One can correct me if I am wrong). Until they get A LOT more signal density in this area it's not going to work very well. (One advantage of CDMA is graceful degradation rather than just getting dropped when signal strength changes). right now it doesn't sound that great. and you have to force it to analog to use modems or fax.

So don't look for digital cellular to make your scanner obsolete tomorrow - though it may be illegal today (ha ha). Before the carriers can get the users "heads out of the sand" and sell them something more secure they have to finish building their new "sand box".

While I don't find cellular monitoring very exciting I know some do. And I support the idea that you should be able to listen to clear text radio traffic for "recreational" purposes if that floats your boat. Encrypted traffic is another story - "keys" are private in my opinion. But for now please carry on and have fun.

>the neighbor across the street.

You are correct in referring to the definition of "broadcast" when it comes to radio. However "broadcast" isn't the term we should use in this discussion. A broadcast is intended to be received by many. But when you talk about two way, point to point communications it is a different story. However that doesn't mean that cellular phone users should expect the same level of privacy with today's cellular technology that they have have their home phone.

Amateurs get an earful on "broadcasting". With just a couple of limited exceptions, broadcasting is prohibited in the Amateur radio service. In these cases it is usually defined as one way transmissions intended for reception by the general public.

Previous laws regarding "eavesdropping" were sufficiant. It was unlawful to disclose or use any information overheard in a radio communication in which you were not participating. Fair enough. This concept goes back to the telecommunications act of 1934. That worked fine until the cellular companies marketed their service as a "just like your regular phone" service and people fell for it. But I won't bad mouth cellular altogether - I have a cellular phone that I find to be a very useful business tool.

I have a good friend that is a engineer with a cellular carrier. He said once that he support the current monitoring prohibitions. "If we are regulated like a regular phone company, we should have the same expectation of customer privacy as regular phone company," was his opinion. My response was that they are regulated as a radio common carrier not a regular phone company - at least on the radio side. Now in California cellular service is also "degraded" by the state PUC which makes them a tarrifed utility. But it's a radio service and it's the responsibilty of the users to provide security of their communcations if the common sense rules are not satifactory. Encrypt your traffic. I support the use of private "keys" and laws forbiding unauthorized possession of keys or wrongful monitoring of encrpypted traffic.

But the radio spectrum is "public domain" in my opinion and our lawmakers were wrong in trying to lock the public out of any of it. - It didn't work anyway.

Hi all! I'm new to the net and to scanning. My son has a Uniden 10 channel scanner he got as a gift a couple of years ago. I found it in the bottom of his closet about a month ago and started playing with it. I started reading this newsgroup around the same time. The bug bit me and I got my PRO2006 last Saturday. All I can say is WOW!! If you are debating about getting a 2006 then I say just get it. You won't be disappointed.`

Now a couple of questions. What are some Shuttle freqs I can pick up in Columbia, SC. I tried the ones posted a few days ago and got zip. Also, what's a good range to search for military air. There is an AF, Air NG, and and Army base within 30 miles of my house. I got the RS discone antenna when I got my 2006, so I should be able to pick these up. Everything else is loud and clear!

Thanks. Please post or E-mail.

P.S. My wife loves the cordless freqs. Kept me out of the doghouse when she asked how much my new toy cost.

> How's the DELAY rate? I thought that it would decrease the delay time,
> so I have not had the guts to try it.
> ------------------

I've done both of these mods to my 2005 that I turned into a 2006. Clipping the diode next to the cell mod diode, speeds up the scan rate 15.4% from 26 to 30 channels/sec. There are NO side affects to this speed-up.

By replacing the CPUs 12MHz crystal that comes with a 2006 with a 16MHz crystal, you can speed up the scan rate by 33% from 30 to 40 Chan/sec. There are many side affects to this mod however. The delay time is shortened by 33% to 1.32 Sec. The spurs (birdies) caused by the CPU clock all move higher in freq and a few new ones appear. I have had no problems with spurs causing problems with the normal scanning that I do, but YMMV.

As far as capturing signals, the VCO in the 2006 is plenty fast enough to settle at the new freq and detect signals in the time remaining. When compared to my un-modified 2006 while connected to the same antenna thru a signal splitter, they were identical except on VERY weak signals. Where either radio would occaisonally miss a signal that the other caught.

I determined that the dwell time per channel was so short, that if, at the instant the radio sampled the signal, it was faded out, the radio would not

detect the signal and scan right past it. If this is a concern and you are

scanning for weak signals, then you should scan at the slow scan speed to
increase the probabilty of intercepting the signal on the first sweep.
If you are sweeping a narrow range when it only takes seconds (ie. <1 Min)
to complete a sweep then you should allow the radio to re-visit the freq
more often by scanning at the faster rate. This is why there are two scan
rates on the radio. With scanning receivers there is a trade off between
re-visit rate and dwell time on each freq that must be considered.

Good scannin' to ya.

DD> Are there any mods for the Bearcat BC 2500XLT scanner to bring in the
DD> 800 MHz. range. Any help would be appreciated. Thanking you in advance
DD> DON.......

Hello from Wheaton, IL. If you have a 2500 that was manufactured before the ban then this mod will do the trick. What is the date code on your unit? Mine is 0CIC, which is March of '93. I went through some problems with mine, but some of them have been worked out. Still have problems with signals bleeding in where they don't belong. Do you have this problem?

Product...Uniden Bearcat 2500XLT
Purpose...Restore full 800 Mhz coverage
w/ 30 khz stepping when required.

** Disclaimer...Modifications are done at your own risk. This product uses surface mount components which make performing this mod difficult. If you are not comfortable with surface mount components, DON'T DO IT. This modification will void your warranty.

** Legal stuff...Performing this mod may enable reception of certain portions of the 800 Mhz band that is forbidden by U.S. federal law.

** BC 2500 models are coming on the market that are not capable of modification. I don't know of the date codes that are effected. To my knowledge, the date codes capable of modification are 0CIC and 0FIC.

This modification is from the Sept. 1993 issue of Monitoring Times, p.94

1. Remove the antenna and battery pack from the unit. Lay it on the face on a soft cloth or towel, bottom of the radio facing you.

2. Carefully pry the back loose from the radio and lift it off. Similarly, grasp the visible circuit board by the edges and carefully pull it away form the radio just far enough to separate it from the white (11 pin) Molex connector. Do not stretch the remaining ribbon connector. Lay the board alongside the radio.

3. Locate microprocessor chip "Uniden UC-1513A" and the cluster of chip resistors marked "104" below it. Using a magnifier and fine point soldering iron, unsolder the lower-left-most chip resistor and move it one place to the left, soldering it in place.

Re-assemble unit.

AD> have test freq's that are enabled when a keyboard sequence is
AD> performed. Has anyone tried these with the 2500XLT? I know there is no
AD> direct search feature w/the 2500 but if it's VFO tuning is similar to
AD> the 890XLT then once the test freq. is in memory (8XX.XXX Mhz) etc, the
AD> VFO tuning (and/or up down buttons) may be able to step thru these
AD> ranges. I'd appreciate any results if anyone has tried this. Thanks.

Hi, Andy...Holding SCAN, 2 and 9 keys while powering up the unit will result in 20 test frequencies. None of the freqs touch the forbidden band. Matter of fact, they don't hit any of the 800 Mhz frequencies.

For info, holding MAN, 2 and 9 keys while powering unit will result in a cleared scanner. No other tricks in this unit.

Adding 400 Mhz to the cellular band will result in image reception at the 1200 Mhz range. Moving a chip resistor will restore continuous coverage on some models.

AD> Is the BC2500XLT double or triple conversion. What are the IF's. I
AD> thought I saw a post somewhere state that it's a triple conversion
AD> receiver. Thanks.

Hi again, Andy...The 2500 is a triple conversion, but not as good as the
'43 triple conversion scheme. No images are present on the '43 scheme, but
the 2500 does have images, though it is triple conversion.

CAC> improvements?

My unit is also 0FIC. (Means the manufacture of the unit is March,
1993.) It is modifiable.

CAC> The BC 2500 is about to be discontinued to make way for the BC
CAC> 3000XLT. Not sure what features it will have but has been speculated
CAC> that service search, (found on the BC220, Pro51 (made by Uniden for
CAC> RS) Sportcat 150) will be included on this unit.

CAC> I am not familiar with the 'service search' feature. What does it do?

Service search is the allocated frequencies already programmed in the
unit. For example, one push of a key will yield only freqs that are
allocated to fire depts. Another key will yield only freqs allocated to
police depts. (BTW, the police dept service search is terrible. Too many
freqs.) Another for air, then another for weather. These are all
pre-programmed into the scanner already for you.

Good signals...Jerry

RRL> take an enterprising Scanner manufacturer to manufacture a GSM or
RRL> DAMPS capable scanner !!!!.

While it is possible for a scanner mfr. to design and market a digital decoder, there would be some legal ramifications from the feds. See, the ECPA of 1986 made it illegal to use or market a digital to analog decoder for the puropose of listening to cellular phones.

RRL> Should'nt be to long. I'm sure there are millions of $$$$$ to be made
RRL> in this area. The signaling protocols etc are not proprietry

RRL> devices as part of the Phd as we speek.

Yes, there will be big bucks. If someone came up with such a device, it would be sold through the underground channels, not in the wide open. Wide open selling of the devices would only be to government agenceis and law enforcement.

SL> what I hear in the school paper? Thanks?

Hi, Sherwin...
According to the Communications Act of 1934...(text from Police Call)

* Reveal to any other person, not a party to the transmissions, the
contents of those transmissions (in other words, keep it to yourself.)

* Use any information heard to aid in committing a crime

* Use any information heard for personal gain.

In answer to your question, IMO, it would be illegal to directly quote
anything you hear on your scanner into the school paper.

MCT> long are these things supposed to last? What burns out on them,
MCT> I do belive they're electroluminesence but I didn't think they
MCT> had a short life.

Hi, Michael...

You are right...it is electroluminesence. With prolonged usage, the EL will dim. The original 2006 had a dimmer switch. The latest versions have an on/off switch. Don't know what the average life is on the 2006. It depends on usage and the voltage applied to them. Obviously, the more voltage, the brighter and the faster they burn out.

I just changed 2 EL panels out on the 2004 models. One I modified to turn off the EL when not needed.

Here is how the EL works...(from the 3/1991 issue of US Scanner News magazine.)

"The field in an EL is created by placing the phosphor based material between two conducting plates connected to the opposite charges. One plate will be metal and the other usually either perforated metal or a form of metalized plastic (in the case of a display panel). The charge between the two plates causes the excitation of the phosphor material and the generation of light. <later in the text> The actual process in the degeneration of luminescent lamps is not understood. "

It is noted in the article that temperature, moisture in the substrate, the color of the lamps and the applied voltage on the EL effect the degeneration of the EL.

Yeah, it does have the tendancy. But at least it helps skip the weak
intermod, too. :)

I'm curious why I haven't seen any messages about this scanner here.
I got a flyer from RS that had it on sale for $179. It's a 50 channel
hand-held with 800MHz. I called Marymac and they said they had already
been recalled by Ft. Worth and didn't have any for sale. I checked a
couple of local stores and they still had a few. Unfortunately, they
were sold by the time I could get around to it.

One of the local store mgrs did claim that he could still order them from
Ft. Worth. True/false? Is it worth the effort of having him order one?
Can cell be restored?

I bought one of them myself so I can play my computer's CD ROM out to the stereo, but that's neither here nor there.

If your local radio shack doesn't still have any, ask 'em to find one for you. They should be able to ask the district office if any are still there.

I got the impression perhaps they actually are a repackaged device from someone else. Check out stores selling Nintendo and Sega games. Those places may have them.

Chester Howes.

: --
: POP: Persistant Online Procrastination milcom@netcom.com

I am not sure what the first reply has to do with the question, but the VHF marine freq.s are located between 156.275 and 157.425 inclusive. The shore station (marine operator, et al) freq.s are 161.6, and 161.8 through 162.0. This info is common knowledge, and the details can be found in the Consolidated Frequency List in the back of your local Police Call. Normally I would not post something that is included in a commercial publication, but as I said, these are easy to get from a variety of sources.

Fun freq.s in the marine band include:
156.8000<ch.16> - Calling and distress. 2-way comm. usually starts here.
157.1000<ch.22a> - Main CG freq. to communicate with vessels
162.0000<ch.28> -
162.9000<ch.26> - Marine Operator (one will be active in your area).

ch.83 is 157.1750.

Have fun, and good luck.
:-)

Source record: 268730

Greetings, and thanks after the fact for all of the great info that I have received from here in the past. I am considering a new scanner purchase to augment my Pro-46. I had pretty much decided on the 2006 until I got the latest Grove catalog, and on page 17 I saw the new AR8000 whcih seems to good to be true. The ad lists coverage from 500kHz through 1900Mhz (no cellular, restorable?), 1000ch. memory, alpha display, RS232 control, adjustble step size in every band, receives am, nfm, wfm, usb, lsb, and cw. All this in a handheld for $649.95.

If even most of this is true, it would be a great deal. I should add that I have use for many of these features, mostly Rx in the SSB marine bands. I am very interested in any info regarding this product. Specifically if it is possible that one unit would have reliable reception on such a wide variety of freq.s. It seems to me that one or more of the bands would have to suffer.

I am a new ham (*im*patiently waiting for my license) so please feel free to give "technical" responses. I would also request that you mail me a response, as the news server at my school frequently spools very fast, and I may miss your valuable response. My address is: bartdoug@teetot.acusd.edu

I will check here for any responses that could not be mailed, and...

Thanks in advance,
Doug

I'm looking to get a good outdoor antenna for my RS 2006. I heard a lot of good stuff about Grove's Discone antenna. What I'm looking for is an antenna that will allow me to receive any freqency that the 2006 is capable of receiving and to do it well. I live 35 miles from New York City. I called Grove's Tech line and was told that the discone was meant mainly for military and aircraft frequencies and that the omni-directional I believe it was antenna 8 (the one that looks like an x) would be more suited for my needs. This antenna sells for $39 while the discone sells for $89. Does anyone have the cheaper antenna or have any recommendations about which one to get? Thanks in advance.

> them in the greater Boston area.>

> 155.475 - National Law Enforcement
> 154.22 - Mass Metro Fire
> 153.965 - Civil Defense
> 47.66 - Red Cross

Well, the first one, 155.475MHz., is designated by the FCC as, well,
the National Law Enforcement frequency. That is, it can be used by
any LE licensee, be they at the state, county or municipal level.
Here in New Hampshire, just about every police unit carries it as
"Channel 2", and it's monitored by all police dispatchers. So, if a
cop from Errol (way up in the White Mountains) was down in the "flat
lands" of Nashua, and needed to get ahold of someone in a hurry, that's
the frequency that would be used. It's entirely possible that there's
no protocol for its use in eastern Massachusetts. (Or just for a dire
emergency?).

As for 154.22, it's just another frequency in the Fire Radio Service. It
would appear that in the greater Boston area, it's used as some sort of
mutual aid or coordination channel. Up in parts of New Hampshire, it's
a secondary fireground channel (in the Capital Area Fire Mutual Aid
Compact); our state-wide mutual aid channel that everyone with a highband
rig can use is 154.280 MHz.

The Civil Defense channel appears to be just another CD channel of the
several that are allocated by the FCC in the low, high and UHF bands.

The last one, 47.66, is probably licensed to the Red Cross, although it's
like their secondary or tertiary channel; 47.42 is the golden oldy that's
been allocated for 20-25 years. No, you probably won't hear much on there
except for an occasional drill. And, I strongly suspect, you won't be in
much of a position to sit and monitor if they did make "real" use of it,
because it's very likely that you and/or your neighbors will be more
worried about the disaster that's in progress!

>Chuck Gysi, N2DUP

Chuck: Please tell where your information comes from regarding the disclosure
of ham radio traffic. Hams are prohibited from broadcasting to the general
public and their two way communications are protected by the comm act of 34
just as part 90 users. This prohibits even other hams from realizing any gain
from overheard traffic in which they are not a participant. The only
exception would be permissable "QST"s of interest to the amateur service and
when amateur radio is used for news reporting (only when other means are
unavailable).

Maybe I haven't gone deep enough into title 47 of the CFR?

I will back the other advise you give to Sherwin.

But what do think of this? During the infamous O.J. Simpson Bronco chase
I heard/saw news reporters holding their mics to scanner speakers during on
scene reports. Illegal? I thought so.

I sent a fax to a San Francisco radio station during their coverage of the
murders at 101 California St. They had a helicopter overhead and the reporter
was relaying minute by minute reports of what he hearing on a scanner
regarding police positions and where the suspect was in the building.
Illegal? If not - it was really grey to me.

One time years ago Roberts was within an arm's reach of a scanner when he had a personal interaction with some Federal agents, so he thinks that everything that ever happens to him or that he hears about should be posted in this newsgroup.

2290. Where to get parts for PRO-2006 Memory Mod?

Newsgroup: rec.radio.scanner
Date: 1994-09-14 18:12:24 UTC
From: dm281@cleveland.Freenet.Edu
Message-ID: <357ee8$3sj@usenet.INS.CWRU.Edu>
Source record: 268768

Okay, I was all ready to make the 6400 Channel Memory Mod on my RS Pro-2006, but almost no one locally (it seems) has the parts I need. I've checked around for that 256Kx8 SRAM. but no one seems to know what I am talking about, even a local scanner shop. (Also, what speed should I ebe looking for and does it matter?) Is there a place where I can mail order this?

Also, I am looking for a 16MHz quartz crystal and a 10K Ohm SIP that I have not been able to find locally.

Please forward responses to dm281@po.cwru.edu.

Thanks,
Ken

I hate that as well. After all, if I wanted you to track me, I'd use a credit card in the first place. There is a REASON I pay cash for most things.

In my case, I just tell them that the last 4 digits of my phone number are "0000". Some of them don't even blink, some of them ask me if I'm kidding. For the salesdroids that don't blink at "0000", I follow up with "1234 Anywhere Ln. / Anytown, USA." Usually they will get the first half typed in before they realize that I'm jerking them around. At that point, I tell them to type anything that makes them feel good.

I've only had them refuse to sell me something once, but it was no big deal... There are about 75 Rat Shack stores in Dallas, and I drive around a lot anyway. The employee turnover rate seems to be high enough, I never seem to deal with the same person twice anyhow. For the most part, I stick to the sidewalk sales or "real" electronic shops. I only deal with Rat Shack in time-critical apps. (Just HAVE to get that connector tonight)

I've also had to show the droids where the stuff is on the shelf before... I've had them swear to me that they didn't stock BNC to Motorola adapters until I walked over and found it myself. And then he practically begged me not to buy it because "You probably don't know what you need, and then I'll just have re-stock it. Please bring the antenna in so I can verify it's the right one."

Droid rant off.

2294. Pro-37 repair parts - withheld?

Newsgroup: rec.radio.scanner
Date: 1994-09-14 18:39:29 UTC
From: dj391@cleveland.Freenet.Edu
Message-ID: <357g11$5l3@usenet.INS.CWRU.Edu>
Source record: 268817

My poor ol' pro-37 developed a bad problem in the keypad and had to go see the scanner doctor. Doctor says a keypad transplant is needed or the poor old '37 bites the big one. Orders a new pad from RS and has now been waiting over 2 months for said part. I suddenly have the awful fear that the rat people are holding parts for any cellular capable radios (the 37 was designed when men were men) in captivity. <sigh> I loved my old '37. Anyone have a comment on this? There seems to be too much hype about big brother's little tantrums already.

2297. Pro-43 Hunters, Beware...

Newsgroup: rec.radio.scanner
Date: 1994-09-14 18:55:05 UTC
From: domonkos@access.digex.net
Message-ID: <4HqTkiubGw73066yn@access.digex.net>
Source record: 268677

In my search for 800Mhz restorable Pro-43's I have come across several units in their boxes w/date codes as early as 6A2, 4A3, and 12A3. I picked up the 12A3 only to find it had an unusual amount of hetrodyne noise on the 406-512 FM bands. I thougt these were birdies but weren't. I exchanged this unit for the 4A3 date code and this one was deaf on the aircraft band compared to the previous unit! I went to exchange it for the 6A2 unit and before leaving the parking lot I noticed a hairline crack right down the middle of the back of the case. I immediately returned the unit and this time walked out with my refund. I suspect all RS may have left if early date codes are units returned and shelved at Tandy and they may be dumping these on the market. Another local scanner enthusiast had a similar story but was able to exchange it for a physically and electrically acceptable unit.

Has anyone else had this expreience? The local dealer has one 12A3 demo left and it looks OK but I was so aggravated I didn't bother to see how it 'played'. Since my goal is mostly triple conversion w/UHF air I may just wait for a fresh supply of non-modifiable units.

Just wanted to warn everyone of a possible trend...

Andy

2298. Re: stupid salesdroid tricks

Source record: 268769

|> BTW, if you bring your out-of-waranty electronics to RS to get fixed, will they
|> try to sell you an extended warranty on the repair?

No, they break it even more or tell you it's unrepairable.

Once, when I had the two part radar detector, I backed down
off of a curb and ripped the connecting wire right out of
the back of the sensor. Took it to RS, they said that it
was unrepairable, "but we have a wide variety of new radar
detectors on sale for this week only!" [sweep an arm across
the top of the glass case] They returned the parts to me,
and I opened the sensor. It seriously looked like they
opened the unit, removed the remaining wire from the connection
with a flathead screwdriver, and immediately put it back in the bag
with an "unrepairable" sticker on it.

Then, I dropped a walkie talkie CB radio once from waist height
perfectly landing on the corner of a stair of an escalator [ouch].
On impact the unit turned on and the internal mic and speaker
got stuck in a feedback loop. I had to use it without a
microphone and I found out later the battery charger died too.
I dropped it off, and six weeks later, after a short burst of daily
phone calls, I got the unit back. The battery charger worked, no
more feedback, BUT THE SQUELCH WAS NOW BROKEN. I had to suffer
through continuous noise to hear an occasional transmission.
Sure, before I had the external mic and the other battery
charger. I quickly missed it's near death state. RS deemed it
useless in not so many words.

Stupid god forsaken rat bastards. And then they whine when we
trash them here? >:| And then it's products like the Pro43, the Pro2006
and the HTX-202 that keep me coming back.. I wish they wouldn't
sway so much with their quality service.

RS of Whitehouse, NJ on Route 22 East. Stay far away.

2299. RE: Confederate Air Force Air Show Freq

Newsgroup: rec.radio.scanner
Date: 1994-09-14 19:34:51 UTC
From: slush@voa.gov
Message-ID: <Cw4x23.13u@VOA.GOV>
Source record: 268725

A previous post on rec.radio.scanner from andym@hq.af.mil (Andy McConnell) noted....

>I listened to the Confederate Air Force (WWII nostalgia rebuilders and flyers)
>on 118.7MHz at Frederick MD on August 27, 1994. This seemed to be their main
>frequency. There was a lot of coordination and behind-the-scenes action for
>their WWII "re-enactment."
>Anyone know if they have their own assigned freq like the Thunderbirds or Blue
>Angels, or do they use local tower frequencies?

CAF uses a number of frequencies when they operate an airshow [according to a co-worker who's active in the CAF].

"Marshalers" (those who direct/move aircraft away from the flightline) are usually found on 49.875mHz nationwide -- regularly referred to as channel "A".

They'll also use the ground freqency(ies) of the airport where they're operating and may also -- with the assistance and coordination of the FAA -- establish one or more frequencies on a "one-time" basis for air boss, ground boss, fueling, operations, etc. There is also usually a freq for the "ordnance and demolition" folks, who coordinate with the air boss for the timing and location of explosions in their re-enactments.

One thing to remember -- these FAA-coodinated freqs will be in the CIVILIAN not military aircraft band.

Happy monitoring!

slush@voa.gov (Joe Gallagher)
The standard "blah blah blah" disclaimer has been cut back to "blah bla" due to funding cutbacks.

2300. ***HAVE YOU HAD PROBLEMS WITH R.SHACK STAFF***???

IMO, if it has to do with Big Brother withdrawing certain freedoms from US citizens that might have some sort of bearing on monitoring freedom, it has everything to do with it.

I didn't even mind seeing the FOI stuff, as it shows how nasty the Fibs can be... of course, if the subject starts drifting out of the realm that has anything to do with scanner freedom, well, IMO, that's when it should go to e-mail or at least drop the rec.radio.scanner crosspost.

Also, as a bit of constructive criticism to Glen, although today's media is different from the past, *I* still consider "News" reporters to be fair and unbiased. While I'm not saying that you lie about any facts, I have seen at times where you have neglected to mention the "other" side of the case. I myself have no problem, as long as I realize that it is one sided, but I suspect that some folks might take what you write as the Whole Story.

2303. Help with BC200XLT Mod...

Newsgroup: rec.radio.scanner
Date: 1994-09-14 20:56:21 UTC
From: jjuarez@nyx10.cs.du.edu
Message-ID: <357o1l$4te@nyx10.cs.du.edu>
Source record: 268734

I recently read a posting about Celluar Freqs Modification for a
Uniden BC200XLT. I decided to take a peek inside my scanner just to
check it out. I followed the directions closely, but I was stumped
when I got to Step 5.

Step 5 reads as follows:

" 5. Locate the (64 pin quad flatpack) microprocessor
IC labelled "UNIDEN UC-1147" and the 10k ohm
(brown-black-orange) leadless resistor positioned
above the letters "DEN" on the IC. "

Rather than a brown-black-orange resistor, there was a small
rectangular-shaped object with "103" printed on it. (There was also
another one over the letters "UNI", but with nothing printed on it.)
I saw other resistors which fit the description, but they were not
at all close to the IC.
Now of course, I wasn't going to perform this modification...

But, there is obviously something wrong with one of three things:

- my scanner

- the instructions

- my understanding of the instructions

If anyone can offer a suggestion, please respond.

Thank You,

jjuarez@nyx.cs.du.edu

2304. Talknet on 948.4875??

Newsgroup: rec.radio.scanner

I had an AOR 2500 for a short time, and it wasn't entirely useless on Short Wave, but it came close. Internal noise drowned out most signals.

In a side-by-side test against two Bearcat handhelds scanning VHF signals, it did very poorly. On upper UHF it picked up a lot of TV images. The attachment to prop it up when on a table kept falling off, and the first AC adapter I got didn't work.

I returned it and got my money back, and then bought an RS-2006 which has none of these problems (of course it isn't short wave, but it works much better as a scanner than the AOR).

Thats a remote transmitter to studio link. Probably fairly close to you seeing as they ar low power.

The local radio station probably does not have a satellite receiver. so another party links it to them.

CHeck out your radio dial and see who is carring it and call the engineer. He may clue you in.

steve

Robert,

It was nice seeing you and knowing that all is in good hands at Seaside! <g>
The address I gave was not quite correct - it is as follows:

kcohan@mpusd.k12.ca.us

The "k" as far as I can determine is the initial of John Cohan's middle name.
I will be checking around to see what else I can find out about this
development.

My wife is still teaching 2nd grade at Crumpton in Marina and she tells me
that computers were installed in many of the classrooms over the summer! I
hope they're not APPLES. She will be coming back to start school next week as
she had to take an unexpected leave before school started due to personal,
family business. I'll be checking out her computer next week sometime!

I was told that you have second period prep - maybe one of these days I'll
drop by for a few minutes of uninterrupted conversation.

Because you can get in the cell range by doing 2,9,man (i think) and it
preprogrames some factory freqs in it.
The frequency it enters is around 880 mhz then you can scan up or down.

2316. 2006 squelch mod. good/bad?

Newsgroup: rec.radio.scanner
Date: 1994-09-15 01:34:45 UTC
From: ab910@lafn.org
Message-ID: <1994Sep15.013445.1420@lafn.org>
Source record: 268761

Okay I did the other usual mods but shy away from the squelch mod due to lack of press. Anybody try it yet?

Locate R152 on main board. It's tricky to get to. Look on the bottom of the board. Got it? Remove it. Replace it with a 100k resistor. Much better hysteresis action.

Let me know the results, please.

> RADIO SHACK sells some very fine products such as their line of scanners
> and Short Wave radios, however I have had many problems with sales staff

I was flat-out lied to when I had trouble with a product by some members of their "staff". Living near Ft Worth, I called their corporate HQ (Tandy Center) and explained my situation. I was polite, but firm, and got action quick. They(the HQ personel) called the store and told them what to do. I drove back and quickly had the problem solved to my satisfaction.

One footnote, when I went back to the store(30 minutes after my initial problem), the employee who was rude and false to me was no where to be seen. :)

Source record: 268629

-=> Quoting Paul Leet to All <=-

PL> I just purchased a BC2500xlt and I am looking to find out how
PL> to modify it for cell reception.

Hi, Paul...

Product...Uniden Bearcat 2500XLT
Purpose...Restore full 800 Mhz coverage
w/ 30 khz stepping when required.

** Disclaimer...Modifications are done at your own risk. This product uses surface mount components which make performing this mod difficult. If you are not comfortable with surface mount components, DON'T DO IT. This modification will void your warranty.

** Legal stuff...Performing this mod may enable reception of certain portions of the 800 Mhz band that is forbidden by U.S. federal law.

** Be advised that units that with date codes ending in "ID" may not be modifiable. Example...Datecode 0FID

This modification is from the Sept. 1993 issue of Monitoring Times, p.94

1. Remove the antenna and battery pack from the unit. Lay it on the face on a soft cloth or towel, bottom of the radio facing you.

2. Carefully pry the back loose from the radio and lift it off. Similarly, grasp the visible circuit board by the edges and carefully pull it away form the radio just far enough to separate it from the white (11 pin) Molex connector. Do not stretch the remaining ribbon connector. Lay the board alongside the radio.

3. Locate microprocessor chip "Uniden UC-1513A" and the cluster of chip resistors marked "104" below it. Using a magnifier and fine point soldering iron, unsolder the lower-left-most chip resistor and move it one place to the left, soldering it in place.

Re-assemble unit.

ASI>
ASI> -This one doesn't have an "A" on the serial number. When I restore the
ASI> 800-900 Mhz bands, do I also get 30Khz steps (like on my 2005?).

Yes, the '43 is worth the extra bucks. The '39 is a double conversion
and will get you images of the cellular band below the actual frequency.
The '43 is a triple conversion and image problems won't be apparent. After
mod, the '43 will step the appropriate 30 khz.

bi> order one? Can cell be restored?

The '23 has been removed from shelves of Radio Shack. (as well as the
'46 and the '51.) Word is they are being re-worked for an 'engineering
defect'. That defect is a keyboard routine that would load test freqs into
the memory. A couple of the freqs just happened to fall into the cellular
band. By having these freqs in memory and doing a direct search, a user
could access the cellular telephone band.

The '23 is not one of the top of the line receivers from RS. The main
drawback is that it doesn't cover 30-50 Mhz range. A range that Illinois
agencies still use.

Scanner users can, for the next couple of days, hear the Space Shuttle as it orbits the earth. The shuttle is talking to ham radio operators when working schedules permit. The Shuttle broadcasts on 145.550 MHz, FM.

For times it is in range check out the rec.radio.amateur.space newsgroup and download the rise and set times as posted.

Good luck!

Brent, VE1JH (just worked 'em)

For those who say print what is heard over the air .... Let me relate a story!

Once upon a time, a New Jersey township moved their operations to a new VHF high band frequency with repeater and all. I had the unfortunate luck to stumble across it because it was a frequency I monitored another town on a long ways away.

Well, one night they had a major incident and as a newspaper editor I dispatched a reporter and photographer to the scene. The officers on the scene were rather miffed that we knew about the incident! They exclaimed that they didn't see how anyone could know about it.

Well, these turkeys tried to pull one on the newspaper and staged an incident a few days later. We fell for it and sent someone out there again.

Needless to say, it was a good thing we followed protocol and sent someone out. Had we printed what happened (which no reporter will ever do under my supervision), we would have looked terribly silly.

I rest my case.

>ECPA of 1986 made it illegal to use or market a digital to analog decoder
>for the puropose of listening to cellular phones.

So? It's illegal to sell frequency inversion descramblers, buy you see kits and articles on how to build 'em all the time. Still legal to date. Any type of cellular encryption is most likely not going to use any kind of public/private key encryption, just plain ol' digital audio. How will the new cell phones decode the digital audio? Probably with a soon to be readily available descrambler IC. Magazines will no doubt publish do-it-yourself articles on how to use this chip in your own descrambler.

Who knows, whatever digital format they use may find it's way into other products as well. I can see the ads now. The New Fischer-Price baby monitor with "CELLULAR SECURITY".

What I want to know is, since the radio community as a whole is slowly moving toward digital, will some digital transmission format be defined as "unencrypted"?

From: ron@wpi.WPI.EDU
Message-ID: <359ek5$ien@bigboote.WPI.EDU>
Source record: 268636

Hi all,

When I turn up the volume of my Pro43, I get a real tinny
resonating sound. It does not happen at low volumes.

Do you think:

1. The speaker is blown or

2. Has loosened from it's mount.

Is it easy to go inside th radio and check that which mounts the speaker
to the rest of the radio?

Is it easy to change the speaker?

I'm not to keen on going near this baby, with a soldering iron.
I worked along time to be able to afford this radio, and don't want to
destroy it.

Thanks for any advice.

>
>Let me know the results, please.
> Matthew D.

As the originator of the PRO-2004 squelch modification, I have yet
to see a PRO-2005 or PRO-2006 which could benefit by a similar
modification. The squelch action in the two later models has
about the right amount of hysteresis, although your PRO-2006 may be
different.

Reprint follows:

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

by Bob Parnass, AJ9S

The squelch control in some FM monitor receivers is
difficult to use because of too much hysteresis. The
American Heritage Dictionary of the English Language
defines hysteresis as the:

o "Failure of a property changed by an external
agent to return to its original value when the
cause of the change is removed."

It's like having play in a car's steering wheel, or
backlash in a gear set. Too much hysteresis in a
squelch circuit forces one to keep the squelch at a
tighter setting, missing weaker signals when scanning
or searching. The squelch hysteresis problem was first
addressed in a 1984 article about the Radio ShackO
PRO-24 crystal controlled scanner.1

Why do engineers design these circuits with any hys-
teresis? Basically, hysteresis prevents weak signals
from "popping" the squelch open and closed rapidly,
which would be very annoying to the listener. A
squelch circuit with hysteresis requires a stronger

signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Bearcat 800XLT2, Radio Shack PRO-2003, PRO-20043, and others. Don't despair, the fix is simple for most radios. Unfortunately, the Uniden/Bearcat 600XLT and 760XLT series use tiny surface mount components, which makes modification very difficult. I've successfully reduced the squelch hysteresis on other models by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. MotorolaO MC3357 and MC3359 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

NOTES:

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

: |> BTW, if you bring your out-of-waranty electronics to RS to get fixed, will they
: |> try to sell you an extended warranty on the repair?

: No, they break it even more or tell you it's unrepairable.

: Once, when I had the two part radar detector, I backed down
: off of a curb and ripped the connecting wire right out of
: the back of the sensor. Took it to RS, they said that it
: was unrepairable, "but we have a wide variety of new radar
: detectors on sale for this week only!" [sweep an arm across
: the top of the glass case] They returned the parts to me,
: and I opened the sensor. It seriously looked like they
: opened the unit, removed the remaining wire from the connection
: with a flathead screwdriver, and immediately put it back in the bag
: with an "unrepairable" sticker on it.

: Then, I dropped a walkie talkie CB radio once from waist height
: perfectly landing on the corner of a stair of an escalator [ouch].
: On impact the unit turned on and the internal mic and speaker
: got stuck in a feedback loop. I had to use it without a
: microphone and I found out later the battery charger died too.
: I dropped it off, and six weeks later, after a short burst of daily
: phone calls, I got the unit back. The battery charger worked, no
: more feedback, BUT THE SQUELCH WAS NOW BROKEN. I had to suffer
: through continuous noise to hear an occasional transmission.
: Sure, before I had the external mic and the other battery
: charger. I quickly missed it's near death state. RS deemed it
: useless in not so many words.

: Stupid god forsaken rat bastards. And then they whine when we
: trash them here? >:| And then it's products like the Pro43, the Pro2006
: and the HTX-202 that keep me coming back.. I wish they wouldn't
: sway so much with their quality service.

^^

I wish I could buy direct from GRE (who makes the Pro43 and 2006). Then
we could cut out the useless middle-men (and probably get a better
price). There are a 'few' good RS people out there, but they don't
last, and get replaced by brain-dead illiterate dead-wood (I think
that covers it).

Perhaps someone has this answer at their fingertips ...
I'm trying to find a table which lists the RF's allocated by the FCC.
Specifically, I'm looking for something like:

police band xxx MHz to xxx MHz
TV xxx MHz to xxx MHz
AM radio "
FM radio "
military "
aviation "

etc.

I think you get the point. If you could point me to a Net source (ftp,
gopher, www, anything), that'd be great. Thanks much in advance.

Sincerely,
Mik T.

The FBI uses transmitters that are monitored by scanners. Letters from
lawyers have to do with Harris Corporation's "cellular scanner."

Many people seem to enjoy things more "interesting" than who transmits on
162.550 mhz (although that did generate a fair amount of response).

....

I can think of two possibilities:

1) You didn't mention if you had modified the PRO-43 by removing
capacitor C341 from the audio stage. If C341 is removed, the PRO-43
audio can start to oscillate (whistle) when the volume control
is adjusted to full volume.

2) There was a batch of PRO-43s built with inadequate speakers. Sorry I
cannot tell you what serial number units are effected.

>Is it easy to change the speaker?

The speaker is glued to the plastic front panel. I was brought a
PRO-43 to repair. It worked fine when the owner first bought it,
but the speaker had become defective and the audio sounded fuzzy.

I recommended to the owner that he return the PRO-43 to Radio Shack
since it was less than 1 year old. Radio Shack replaced the speaker
under warranty.

Here is an old posting about obtaining a better PRO-43 speaker.
I think Steve Hobrecht is the original author:

The Military is rumored to have a cellular-like communications system that
operates in this band. Also, I have specifically heard references to a
military medical frequency in the 540 MHz range.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

This introduction is intended for people new to the scanning hobby and is oriented to scanning in the USA. It tells where you can buy your first scanner, what features it should have, where to get it repaired if required, how to get frequency information, and mentions a few scanner clubs worth joining.

Why Scanning?

Every day and night, scanner hobbyists are entertained by what they overhear on their radios. Police cars, fire engines, ambulances, armored cars, trains, taxis, airplanes, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Listen in the 46.61 - 49.97 MHz range to your neighbors deal drugs over their cordless telephone, or as their conversations are picked up and transmitted over the airwaves between 49.67 and 49.99 MHz by their sensitive baby monitor intercom.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots.

Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

You can even listen to the order taker's wireless microphone at the local McDonald's restaurant on 154.6 and 35.02 MHz!

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the ECPA. Change is in the wind -- when existing stocks are depleted, it will be illegal for companies to | sell scanners which cover or can be easily modified to | cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted laws against | listening to cordless phones, but it's currently legal to listen in most states. You can find out about these restrictions in a 39 page paperback, ANARC Guide to U. S. Monitoring Laws, compiled by Frank Terranella, available for $7.50 from ANARC Publications, P.O. Box 462, Northfield, MN 55057.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners bear the Realistic label but are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend AOR brand scanners.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies

into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners almost always provide more audio than portables, and portables are usually more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band unless you live in a very rural area where this band is not used. Usage of the 800 MHz band is growing by leaps and bounds.

If you're not sure whether you'll like scanning, don't want to spend much money, a 16 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. | Although some scanners receive the short wave band, their performance in that range is often poor.

Deluxe scanners can be controlled by a personal computer, | although this feature isn't important to many scanner | owners.

Currently, the more popular scanners include the Uniden/Bearcat 760XLT (a/k/a 950XLT) and Radio Shack PRO-2006 base/mobiles, and the Uniden/Bearcat 200XLT (a/k/a 205XLT) and Radio Shack PRO-43 portables.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so. Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-

801, can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be somewhat more prone to lightning strikes because they are not at "DC ground."

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- Marymac Distributing (Katy, TX) sells Radio Shack scanners at discount, but charges a 20% restocking fee for returned merchandise. Telephone (800)231-3680 and (713)392-0747.

- Scanner World (Albany, NY). Telephone (518)436-9606.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Many ham radio dealers, like Amateur Electronics Supply (Milwaukee, WI, (800)558-0411), also sell scanners.

Used scanners may be found at hamfests, flea markets, | garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

If you are handy with a soldering iron, you may be interested in modifying your scanner to add features or enhance its performance. Be warned this usually voids your warranty. Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

ftp.cs.buffalo.edu
garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and stocks parts for several older models. G & G sometimes buys old scanners, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores.

I also recommend the book, Monitor America, 2nd edition published by SMB Publishing, and available from Grove Enterprises for about $25. This single edition contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more

sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's 168 page Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 6th edition is available from Grove Enterprises for about $19. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and Kneitel's sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. It will likely disappoint experienced scanner hobbyists and is better suited for beginners. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The DOS access software is somewhat difficult to use and the frequencies are displayed with annoying leading zeroes.

Grove enterprises sells FCC license information on floppy disks. Disks for each state are sold separately, and the information is basically the same as the FCC "state sort," i.e., transmitter location (state/city), callsign, licensee

name, and type of license. Some hobbyists find Grove's DOS | access software is easier to use than the PerCon CDROM | access software. |

About 15% of the FCC licenses, including many fast food | restaurants, contain transmitter latitude and longitude but | specify no transmitter city. To determine the location of | those transmitters requires using the latitude and | longitude information. |

I developed a process which produces a color map of FCC | licensed and selected FAA transmitter sites in an area, | given a center location (latitude/longitude) and a range | (in miles). I call this new innovation a RadioMap. It | allows you to identify antenna sites (including paging and | cellular phone cell sites) and visualize the transmitter | locations in your neighborhood, near your office, at an | airport, and other places of interest -- from VLF through | microwave. Streets, rivers, and ham radio stations are not | shown as they would clutter the RadioMap. RadioMap | includes key sheets which list frequencies, callsigns, and | licensee names. In rural areas, ranges of up to 10 miles | are possible, while ranges of 1/2 to 2 miles produce best | results in urban cities. |

Currently, I can produce custom color 8-1/2" by 11" | RadioMaps, suitable for framing or laminating, only for | areas in Illinois, Indiana, Wisconsin, Michigan, and New | York. Send $17 for each color RadioMap, your name, | address, and telephone number, along with center location | (lat/long or nearest intersection of 2 streets) to: Bob | Parnass, 2350 Douglas Road, Oswego, IL 60543.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio users to identify their operations with their assigned call letters, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the

immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $24.00 per year, which includes the monthly RCMA Journal, which consists of approximately 95 pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,

Springfield, OH 45503.

AOSC questions can also be sent electronically to:

rccons!aosc_hq@telerama.pgh.pa.us or
dave.marshall@f240.n108.z1.fidonet.org.
FidoNet: 1:108/240.0

AOSC also has a MEMBERS & EDITORS Scanner related echo, AOSCNet, distributed via FTN on 6 BBS systems, and via Internet Mailing list. Rick Christian advises these strict rules for the AOSCNet Scanner Radio Echo (as of 2/1/94):

1. No discussion of cellular modifications or discussions on how to monitor cellular transmission.
2. No discussions on topics which would violate the ECPA '84, TDDRA '93, (18 USCA 2510 et seq.) or Communications Act 1934 & 1984 as amended (47 USCA 705), i.e., decoding/reception of paging, cellular, encrypted stuff, descrambling etc..
3. No Aliases.
4. No discussion of Shortwave or Amateur Radio material (except SAREX).

For info on the ECHO only, contact:

R.E. Christian, AOSC PA/AOSCNet Founder

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members sometimes sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $10 check, payable to Kim Moran, to:

The Command Post
attn. Kim & Ted Moran
6143 W. Touhy Avenue
Chicago, IL 60646

Many CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (708)852-1292.

Here is a tentative meeting schedule for the remainder of 1994. All meetings will be held on Saturdays at the Destiny Restaurant, 1440 Rand Road, Des Plaines, IL:

October 15
December 10

Bring a notebook and your appetite.

2353. Re: ***HAVE YOU HAD PROBLEMS WITH R.SHACK STAFF***???

Newsgroup: rec.radio.scanner
Date: 1994-09-15 15:38:40 UTC
From: jackson@longlast.cs.nyu.edu
Message-ID: <359pq0$ic8@thecourier.cims.nyu.edu>
Source record: 268714

In the same session that prompted my "stupid salesdroid tricks"
thread, the guy finally wanted me out of his face, and while
asking him about mobile powering options, I showed him
a lighter adapter I have whose plug fits into the HTX202.
When I prompted him about the suitability of a 250VA
fuse, he replied, "yeah, sure, that should be just fine..
have a good day."

So, my question is, what kind of fuse should I put in there?
I've been using that assembly to power my 2005 and haven't
had any problems at all. Can I use that on my HT and
stop charging batteries all the time? or should I switch
back to a 2A fuse for that feed?

Thanks-- steve.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

I am often asked, "How do you find these frequencies?" Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books

The most convenient source of fire and police frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores for under $10. Police Call is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. Later editions have included a few pages of local airport and nonsensitive federal government frequencies.

I highly recommend Richard Barnett's 1992 book, Monitor America, published by Scanner Master Corp., and available from Grove Enterprises for about $25. This second edition is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the world's largest scanning club, the Radio Communications Monitoring Association (RCMA). Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Beyond Police Call, available from several sources including Radio Shack, covers the business, schools, and other stations not covered by Police Call, its sister publication. One volume covers the entire USA, but no call signs are shown.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The second edition is about 400 pages and is available from Official Scanner Guide. The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $20. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is the best book in print for this difficult to obtain information.

A more accurate, but smaller and less comprehensive book is Midwest Federal Frequency Directory. It was published in 1986, and copies are getting scarce. Copies may still be available for $10 from Scan America.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells the information on PC floppy disks for each state instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The DOS access software is somewhat difficult to use and the frequencies are displayed with annoying leading zeroes.

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me. |

About 15% of the FCC licenses, including many fast food | restaurants, contain transmitter latitude and longitude but | specify no transmitter city. To determine the location of | those transmitters requires using the latitude and | longitude information. |

I developed a process which produces a color map of FCC | licensed and selected FAA transmitter sites in an area, | given a center location (latitude/longitude) and a range | (in miles). I call this new innovation a RadioMap. It | allows you to identify antenna sites (including paging and | cellular phone cell sites) and visualize the transmitter | locations in your neighborhood, near your office, at an | airport, and other places of interest -- from VLF through | microwave. Streets, rivers, and ham radio stations are not | shown as they would clutter the RadioMap. RadioMap | includes key sheets which list frequencies, callsigns, and | licensee names. In rural areas, ranges of up to 10 miles |

are possible, while ranges of 1/2 to 2 miles produce best | results in urban cities. |

Currently, I can produce custom color 8-1/2" by 11" | RadioMaps, suitable for framing or laminating, only for | areas in Illinois, Indiana, Wisconsin, Michigan, and New | York. Send $17 for each color RadioMap, your name, | address, and telephone number, along with center location | (lat/long or nearest intersection of 2 streets) to: Bob | Parnass, 2350 Douglas Road, Oswego, IL 60543.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA)1. Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'2.

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular

meetings. Club dues are collected annually, which covers a monthly newsletter, the RCMA Scanner Journal, about 95 pages long. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. A recent liberalization of club policy now permits the printing of most federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542
Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

The real challenge is deriving new spectrum usage information. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

More about sleuthing will be discussed in Part II of this article.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?
Part 2: Sleuthing

by Bob Parnass, AJ9S

Part I of this series discussed how scanner enthusiasts can obtain frequency information from books, government microfiche records, or other listeners. This installment discusses digging up new frequencies on your own.

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of

information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army

Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the

channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

How Can I Determine To Whom I'm
Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described in Part I of this article, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the

customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

Anybody with enough money can buy a brand new scanner, but you can save lots of money if you get a good deal on a used scanner. Hamfests are probably the best place to find used radios, but you must be familiar with the equipment. Hamfests are repleat with older radios you won't see in today's catalogs.

At last count, there were over 70 scanners and monitor receivers of various brands in my collection. I purchase most of my receivers at hamfests or horsetrade with other radio hobbyists. This article describes a few of the FM receivers in my collection, and is not meant to be complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Several people have been pleased with Electronic Repair Center, in Franklin Park, IL, which repairs scanners for a flat fee. Call them at (708)455-5105 to find out their current rates. G & G Communications (telephone 716-768-8151) is another scanner repair company. This family owned company repairs scanners and stocks parts for several older models. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, | BCL, and BCU models, did not provide individual channel | lockout capability. Electra didn't use the term "scanner" | and instead called these innovative radios "business | receivers." Other models, like the SBE Sentinel, employed | a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar

Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series. Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Bearcat BC-101, Radio Shack COMP 100, and Tennelec MCP-1, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

Radio Shack scanners contain a reasonable number of features. All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. A few years ago, the Regency and

Bearcat scanner lines were purchased by Uniden, a Japanese company, and production was moved to Asia.

My favorite VHF/UHF receivers are the 300 channel Radio Shack PRO-2004, the newer 400 channel PRO-2005 and PRO-2006, and the ICOM R7000 and R7100. The ICOM models are more "communications receiver" than a conventional scanner.

Other favorites include the Bearcat 300 and 760XLT, Regency M400, and the Regency K500 (predates the M400), all of which include a "service search" feature.

For portable use, I prefer the Radio Shack PRO-43 and Uniden/Bearcat 200XLT.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

ICOM

R-7000: At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be

installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but has better IF filtering and contains front-end circuitry for VHF-low, VHF-high, and UHF bands. No aircraft band coverage. Three crystal filters. Front mount speaker sounds good. No rescan delay.

Bearcat 12 (Electra): One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

BC101 (Electra): First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC220 (Electra): 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC20/20 (Electra): A BC220 but with 40 channels. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store

feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC350 (Electra): 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

800XLT (Uniden): 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives

10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels.

BC100XLT (Uniden): Excellent 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): Excellent 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The

most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Radio Shack

PRO2004: Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio.

PRO2005: Radio Shack's top of the line scanner for 1989 and scanner of choice. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although there is no mobile mounting bracket available and the keyboard is not backlit. More

sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended.

PRO2006: Radio Shack's 1994 top of the line scanner. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended.

PRO34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to

radiate signals into nearby receivers.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO24: Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar:

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e.,

no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2526	10	X		yes	yes
FR2526	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

REPAIR TIPS: BEARCAT SCANNER RADIOS |

Copyright 1993, 1994 by Bob Parnass, AJ9S |

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or |
publications which charge for service without permission of
the author. Free distribution is encouraged.]

Introduction |

The original Bearcat scanner line was manufactured by |
Electra of Cumberland, Indiana. In the mid 1980s, Uniden |
bought out the Bearcat scanner line and Uniden's first |
Bearcat scanner was the 800XLT model. |

Most of the models discussed in this article are |
base/mobile units made by Electra during the 1970s and |
1980s. Electra stamped all of its scanners with a |
manufacturing date code on the rear of the cabinet. The |
code is comprised of a single character (C = Cumberland, |
Indiana, P = Puerto Rico), followed by four digits denoting |
year and week the radio was built. For example, "P8422" |
denotes the radio was made in the Puerto Rico factory |
during the 22nd week of 1984.

Schematics and Parts Available |

Schematic diagrams may be obtained from Uniden/Bearcat's |
parts department, (317)842-2483. |

G & G Communications (telephone 716-768-8151) is a family |
owned company which repairs scanners and stocks parts for |
several older models, especially Electra/Bearcat and |
Regency brands. They are located at 9247 Glenwood Drive, |
LeRoy, NY 14482. |

Electronic Repair Centers in Franklin Park, Illinois |
(telephone 708-455-5105) has been repairing Bearcat |
scanners for several years. They charge a flat $45 repair |
rate for programmable and $30 for crystal scanners, and |
shipping is extra. Electronic Repair Centers will fix |
Regency scanners if they can obtain the parts. |

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, | BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem. |

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In two of the BC300 scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer | failed, causing the output of the supply to drop below the | level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. The 22uF/16V * capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

I recently replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated | IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden. |

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. | Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times. *

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints. |

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a | flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know

if this is a common problem. |

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition. |

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, | e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board. |

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem. |

Other Problems

Complaints of low audio output and occasional microphonics | in a Uniden/Bearcat 800XLT was caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

2357. Re: Media and Scanner?

Newsgroup: rec.radio.scanner
Date: 1994-09-15 15:50:04 UTC
From: malxndr@aol.com
Message-ID: <359qfc$2e9@newsbf01.news.aol.com>
Source record: 268692

Whether someone could print conversations overhead on a scanner in a school newspaper or any other publication would probably not fall under any of the communications laws. I'm not a lawyer, but I'm a journalist.

I'd bet the issue would involve balancing the First Admendment against say, EPCA. That is, if I heard something on a scanner, deliberately or accidently, and it was newsworthy, it is conceiveable that I would use bits or even all of the conversation in a news story. I would attempt to contact the people I overhead, but I that would always be possible. There are so many variables here that I can't say exactly what I would do specifically--it would involve the actual conversation, how I came upon it, what the key issues are as to the story's newsworthiness and so on. In any case, I have seen many instances where conversations overhead on a scanner have appeared in print. New York magazine had an article within the past year in which the writer--I think his name was Craig Bromberg-- liberally quoted from cordless conversations. The journalists writing these articles, however, generally do not attribute the conversations to particular individuals. In the case of the budding school journalist, I'd say run the conversation but keep in mind that you may find yourself battling for the First Admendment at the same time!

2358. Kauai freqs wanted!

Newsgroup: rec.radio.scanner

My fiancee & I will be honeymooning in Kauai in two weeks. Naturally, we'll be bringing along our PRO-43 (but only to enjoy during periods of total exhaustion :). If anyone can supply us with interesting freqs for the "Garden Island", we'd be much in your debt... and maybe even name our first born after you!

Reply via email or posting to this group.

" I was flat-out lied to"

It must be in their training to never say "I don't know". I have a degree in Electronics and I have heard tons of incorrect information uttered. While I have had many intellegent discussions with RS employees and I have had some informative instruction about things that I wasn't very knowledgeable, I have found that a significant number of people would rather snow people than find out the correct answer. IF they sense you are not technical they will frequently try to pull the wool over their eyes.

What exactly is the problem with the keypad? I have a PRO-37 also.

It's a rubber sheet with molded in buttons. The bottom of each button
is a carbon composite rubbery surface that bridges two metal pads
on the circuitboard below, and thus makes contact. You will find that
over time, the contacts will get dirty, making for erratic operation.

I have made my keypad behave like new. Take it apart and clean the
underside of each small rubber button with just water and a t-shirt
type rag (no paper towels, they leave particles behind). Just dampen
the rag and wipe gently. I suppose you could use window cleaner
or rubbing alchohol, but I used water and it worked. You also
will want to use window cleaner or alchohol on the metal pads that
the buttons touch. They tarnish slightly over time. If they are
real bad, you can lightly rub them with a pencil eraser which
will shine them up. Make sure you clean off the eraser bits.
In any case, I would not use any other solvent
like mineral spirits or lacquer thinner, too abusive. You could
probably safely use that spray contact cleaner you get at
electronics stores. You may also want to clean the keyboard lock
switch too. Be careful re-assembling. If still does not work,
check actual wire connections to the keypad part of the circuitboard.

Dont let those Radio Scrap dopes ruin your fun. Do it yourself.

Hope this helps.

Mike

> If anyone can offer a suggestion, please respond.

>Thank You,

The later model BC200XLT units use SURFACE MOUNT resistors
as opposed to the 1/8 Watt axial carbon composition resistors
that have the color bands referred to in the modification
instructions you described.

The surface mount 10k-Ohm resistor
is labeled "103". It IS above the "DEN" of "UNIDEN" on the
microcontroller. If you have experience (or have steady hands
and are willing to take the risk), just cut the bugger in
half with a very sharp set of small side-cutters (dikes/dykes? ;-)

Make sure to remove any residue and that you don't damage any
solder pads or traces. Good luck. It worked just fine for me.

In article <robinett.22.001634C8@cscns.com>, robinett@cscns.com (Rob Robinette) writes:

Hi Rob,

Yes, there is Windows software available for the OptoScan456. I write a shareware program called Radio Manager for Windows. It originally control just Icoms, but as of version 2.01, just released, it also supports the OptoScan456. It's available in CompuServe's HamNet Scanning Library, in the file RM.ZIP. It should also be available on America Online in the next day or so. I'm working on getting it on an ftp site. You can also send $3.0 to me for the unregistered version or $30.00 for the registered version, and I'll send you a disk. My address and a detailed decscription are below.

Radio Manager for Windows 2.01 9/14/94

Radio Manager for Windows is a radio control program for the Icom R-7000 Radio. It should also work with other Icom radios. New version 2.0 works with the OptoScan456(tm) from OptoElectronics. Radio Manager handles scanning, delays, 5 priority channels, lock-outs, presets, search ranges and
more. You can choose your own delay amounts and priority checking intervals.
Radio Manager stores data in Bank Files that can have 999 banks each. Within a bank you can have 999 channels. That's 998001 channels! Your computer's memory may limit this. You choose your own channel and bank numbers. Each bank can have a description, and be enabled or locked out. Radio Manager comes with Frequency Manager (see FM.TXT), so you can organize your frequency list. Radio Manager can then extract information from Frequency Manager files when needed.

F E A T U R E S

* Windows -- you can run other programs while Radio Manager scans!
* Each channel has a class and service description
* User defined banks and channels (as many as 998001 channels!)
* User defined Delays and Priority Intervals
* Lock-out individual channels or entire banks
* Lock-out Review shows individual channels that are locked-out
* Unlimited number of search ranges and bank files
* 5 Preset buttons for easy access to your favorite channels
All 5 can be checked regularly as priority channels.
* Scan and Search up and down
* Select Delays for individual channels
* Control primary functions from iconized control menu.

* History Window shows last 999 active frequencies
* Look Up feature displays information on known frequencies
* On-line Help
* Number of files only limited by free disk space
* It's shareware. If you don't like it don't buy.
If you do, it's a bargain price!
* Import from Frequency Manager and 801-Scan files.
* Tone Logging with OptoScan456.

Version 1.01 5/24/93 adds the following features and fixes...
* Mode Delay - If Radio Manager sets the frequency on your radio OK,

but not the mode, you can increase this setting to make Radio
Manager work with your system.
* History Window Hits - Radio Manager now includes the number of
times
that active frequencies are listed in the History Window.
* History Window Save - Radio Manager can now save most of the
information from the HistoryWindow to a text file. This
information
can then be manipulated using other programs for analysis.
* History Window Limit - The upper limit has been increased to 999
* Import - You can now import Frequency Manager files directly to
Radio Manager Bank Files. You can now import 801-Scan text files
directly to Radio Manager Bank Files.

Version 1.02 6/2/93 adds the following features...
* Multiple Priorities - now you can choose your 5 favorite
frequencies
as priority channels.
* Scan forwards and BACKWARDS. Great for returning to a previously
active frequency.
* Radio Manager now has Channel delays instead of Bank delays.
* Search Ranges from previous sessions automatically restored.
* Control Menu Commands added for easy control while working in
other
Programs: Who is it?, Scan, Search, Manual, Lock Out

Version 1.03 (7/25/93) fixes a few bugs reported by users, and adds or
improves the following.

* Scan Direction Bug Fixed - Radio Manager now remembers which
direction to scan from last session.
* History Window Bug Fixed - Partially input frequencies no longer
show up in the History Window (i.e. 1, 12, 123, 123.1) until
you've
hit ENTER, and there is activity on the frequency.
* History Window Position Saved - Radio Manager now remembers where
you positioned the History Window from the last session.
* Add Trunked Systems Quickly - Radio Manager now lets you quickly
enter a trunked radio system that has several frequecies that
are evenly separated. See Add Trunked System in Help.

* Priority Bug in Manual mode Fixed - Radio Manager now returns to
the
previously active frequency (even if it's not included in the
current bank file) in manual mode after checking the priority
channel(s).
* Active Priority Channels Displayed under the Priority Check Box
This makes it quick and easy to see which priorities are enabled.
* For SWL folks and those not using the R-7000 Support for passband
widths and additional modes has been added (I think). See Mode
Box
in help for details.
* Radio Manager now supports more precise tuning to 1Hz.

Version 1.04 (3/7/94) fixes a few bugs reported by users.

* Read and Write delays from and to the radio should work on faster
machines now.
* Should set frequencies less than 1MHz on R-9000.
* Expanded Trouble-Shooting section in Help.
* Automatically corrects some problems related to file changes.

Version 1.05 (6/27/94) fixes a few bugs reported by users, and adds or
improves the following.

* Edit Frequency Manager records in Radio Manager
You can now edit Frequency Manager records in Radio Manager
without running Frequency Manager.
* More Fields in Frequency Manager (Last Monitored Date, Brief note,
and Rating.)
* Lock Outs for Searches
* Easier Bank File Editing
* Faster Search Speed
* Easier to Customize and Automatic Corrections
* You can now use the Channel Scroll Bar left and right arrows to
change scan direction.
* While you can't control more than one radio at a time with Radio
Manager, you can set up different configuration files for
different
radios.
* Radio Manager automatically corrects search ranges when you
reverse
the upper and lower limits by mistake.
* The step size is automatically set to last search step.
Bug Fixes
* Fixed the GPF when the Delay button was selected, and no bank file
was loaded.
* The first bank with channels is automatically selected when no
other banks are selected.
* Frequency displayed when iconized and searching.
* Finally, "Lock-Ups" should be fixed. You should no longer have
to

press ALT to open dialogs.
* Fixed Look Up unknowns which wasn't always working.
* Switches channels correctly with radios with more than 99
memories.

Version 2.0 (8/30/94) Now supports OptoScan456(tm) by Optoelectronics.
* The OptoScan456 is a new interface for the Pro 2005/6 scanners
from Radio Shack. The OptoScan456 decodes CTCSS and DCS squelch
tones, as well as DTMF digits. It also reports signal strength.
Contact Optoelectronics for more details if you don't have one.
1-800-327-5912
5821 NE 14th Avenue, Fort Lauderdale, FL 33334
* New signal detection methods added.
Radio Manager now lets you choose from Hardware detections methods
including Ring Indicator Pin 22, or Carrier Detect Pin 8, or soft
ware detection if you've got an Icom R72, R7100, or R9000.
* Common Setups can be saved if you control more than one type of
radio.
* Temporary Lock Out - Lock Out a channel for a specified time.
The channel will automatically be unlocked after the time has
elapsed.
* And a few more bug fixes.

Version 2.01 (9/14/94) More OptoScan456 support and bug fixes.
* Automatically Displays and Log DCS and CTCSS tones.
* Tone Scanning (still under construction, but it's better than
nothing.)
* Fixed GPF that occured after renaming a file
* Adds Tone field to Bank File
* You don't have to restart after most changes to the Radio Setup
* Fixed slow displaying of message boxes and dialog boxes.
* Fixed some odd problems in the Bank Editor
How to purchase Radio Manager for Windows

Radio Manager is a shareware program. This means you can have a copy for
free, until you are sure that you like it and want to keep using it, after

that you must register a copy if you continue to use it. When you
register
your copy, you'll get the latest version without the startup dialog box.
If
you are using the Unregistered Trial Copy and would like to order Radio
Manager please choose Order Radio Manager from the Help menu and print
and complete the order form as described in the help file. For $30.00
(includes shipping) you'll get a diskette containing the latest version of

Radio Manager and Frequency Manager. Texas residents add 7.75% sales tax.

Registering with Credit Cards including Master Card, Visa, American
Express, and
Discover. You can order directly from me as described above, or from
Public (Software) Library

(PsL) with your MC, Visa, AmEx, or Discover card by calling 800-242-4PsL (outside the United
States: 713-524-6394), or by FAX to 713-524-6398, or by CompuServe to 71355,470. These
numbers are for ordering only. Ben Saladino cannot be reached at those numbers. To contact
Ben Saladino for information about dealer pricing, volume discounts, site licensing, the status of

shipment of the product, the latest version number, or for technical information, call Ben
Saladino at 817-282-0331 or write to me at 660 W. Oak St. Hurst, TX 76053-5526.

Radio Manager's registration number at PsL is 10989. Please specify your preferred disk size.

Credit Card Pricing
Registration fee $30.00, Handling Charge in the US $5.00, Handling Charge outside of the US
$7.00. Texas residents will be charged tax.

System Requirements:
* 80386 and higher IBM PC and Compatibles with 4MB RAM
* Windows 3.1 or Higher (running in Standard or Enhanced Mode)
* SHARE.EXE must be loaded for Radio Manager to function properly
* A hard disk with 2MB free disk space
* A 3.5" or 5.25" floppy drive
* An available Com Port and a Computer-Radio Interface that supports signal detection with the Ring Indicator (pin 22 of RS-232 connector), or Carrier Detect (pin 8 of RS-232), or software signal detection for the Icom R72, R7100, and R9000 radios. Radio Manager works with the ICOM CT-17 interface, but it will not stop scanning when a signal is present, unless you modify your CT-17 as described in the help file or have a radio listed above that supports software detection. A 9600 BPS connection is strongly recommended.
* An Icom R-7000, R7100, or R9000 radio, or a Pro 2005/6 scanner with
and OptoScan456. Other Icom radios should work too, but only the R-7000 has been tested by me. Please let me know if your radio
works or doesn't work. Works best when communication between computer and radio is set to 9600 bps.

I N S T A L L A T I O N for unregistered copies.

To install Radio Manager, simply copy the files in the RM.ZIP file into a directory of your choice. Then create an icon by choosing the FILE|NEW menu item from the Windows Program Manger. Click on the OK button or press

ENTER. Complete the Program Item Properties dialog box and press ENTER.
See the extensive on-line help to learn how to use Radio Manager. You'll
probably need to change items in the OPTIONS|RADIO SETUP menu item that
are
specific to your setup.

*** If you get a message asking "Is SHARE.EXE Loaded?" when you try to run
Radio Manager or Frequency Manager then add the line below to your
CONFIG.SYS file located in your root directory. You can use a text editor

to change the file. You might need to specify a different directory than
the one below depending on the location of SHARE.EXE on your system.
SHARE.EXE is included with DOS.

Install=C:\DOS\SHARE.EXE /L:500

If you have questions, comments, or suggestions please contact...

Well, I think that the software needed depends on the paging hardware
used in your area. I have Motorola Advisor pager and I am sending also a
lot's of messages out just by using ordinary terminal emulator and
modem. At least in this particular system no specific software is needed
although such is available.

Here's the letter I received with the information on Radio Manager:

-----<SNIP>

From BSaladino@aol.com Mon Sep 12 10:56:06 1994
Subject: Radio Manager for Windows

Hi Paul,

Thanks for your interest in Radio Manager for Windows. I haven't tried it on OS/2 myself, but I know of one user who was doing that a while back.

If you are wanting to control the OptoScan456, I've only uploaded version 2.0 (previous versions only controlled Icoms) to CompuServe's HamNet Scanning library (RM.ZIP). I'm working on some bug fixes and enhancements, and hope to upload it what will probably be 2.01 in the next few days. I'll try to get it on an ftp site, as well as America Online to start. Or you can send me $3.00 for the unregistered version, or $30.00 for the registered version, and I'll mail you a disk. The $3 can be applied to the $30 if you decide to register. Send to address below.

Here's a detailed description...
Radio Manager for Windows 2.0 8/30/94

Radio Manager for Windows is a radio control program for the Icom R-7000 Radio. It should also work with other Icom radios. New version 2.0 works with the OptoScan456(tm) from OptoElectronics. Radio Manager handles scanning, delays, 5 priority channels, lock-outs, presets, search ranges and more. You can choose your own delay amounts and priority checking intervals. Radio Manager stores data in Bank Files that can have 999 banks each. Within a bank you can have 999 channels. That's 998001 channels! Your computer's memory may limit this. You choose your own channel and bank numbers. Each bank can have a description, and be enabled or locked out. Radio Manager comes with Frequency Manager (see FM.TXT), so you can organize your frequency list. Radio Manager can then extract information from Frequency Manager files when needed.

F E A T U R E S

* Windows -- you can run other programs while Radio Manager scans!
* Each channel has a class and service description
* User defined banks and channels (as many as 998001 channels!)
* User defined Delays and Priority Intervals
* Lock-out individual channels or entire banks
* Lock-out Review shows individual channels that are locked-out
* Unlimited number of search ranges and bank files
* 5 Preset buttons for easy access to your favorite channels

All 5 can be checked regularly as priority channels.
* Scan and Search up and down
* Select Delays for individual channels
* Control primary functions from iconized control menu.
* History Window shows last 999 active frequencies
* Look Up feature displays information on known frequencies
* On-line Help
* Number of files only limited by free disk space
* It's shareware. If you don't like it don't buy.
If you do, it's a bargain price!
* Import from Frequency Manager and 801-Scan files.

Version 1.01 5/24/93 adds the following features and fixes...
* Mode Delay - If Radio Manager sets the frequency on your radio OK,
but not the mode, you can increase this setting to make Radio
Manager work with your system.
* History Window Hits - Radio Manager now includes the number of times
that active frequencies are listed in the History Window.
* History Window Save - Radio Manager can now save most of the
information from the HistoryWindow to a text file. This information
can then be manipulated using other programs for analysis.
* History Window Limit - The upper limit has been increased to 999
* Import - You can now import Frequency Manager files directly to
Radio Manager Bank Files. You can now import 801-Scan text files
directly to Radio Manager Bank Files.

Version 1.02 6/2/93 adds the following features...
* Multiple Priorities - now you can choose your 5 favorite frequencies
as priority channels.
* Scan forwards and BACKWARDS. Great for returning to a previously
active frequency.
* Radio Manager now has Channel delays instead of Bank delays.
* Search Ranges from previous sessions automatically restored.
* Control Menu Commands added for easy control while working in other
Programs: Who is it?, Scan, Search, Manual, Lock Out

Version 1.03 (7/25/93) fixes a few bugs reported by users, and adds or
improves the following.

* Scan Direction Bug Fixed - Radio Manager now remembers which
direction to scan from last session.
* History Window Bug Fixed - Partially input frequencies no longer
show up in the History Window (i.e. 1, 12, 123, 123.1) until you've
hit ENTER, x
in help for details.
* Radio Manager now supports more precise tuning to 1Hz.

Version 1.04 (3/7/94) fixes a few bugs reported by users.

* Read and Write delays from and to the radio should work on faster
machines now.
* Should set frequencies less than 1MHz on R-9000.

* Expanded Trouble-Shooting section in Help.
* Automatically corrects some problems related to file changes.

Version 1.05 (6/27/94) fixes a few bugs reported by users, and adds or improves the following.

* Edit Frequency Manager records in Radio Manager
You can now edit Frequency Manager records in Radio Manager without running Frequency Manager.
* More Fields in Frequency Manager (Last Monitored Date, Brief note, and Rating.)
* Lock Outs for Searches
* Easier Bank File Editing
* Faster Search Speed
* Easier to Customize and Automatic Corrections
* You can now use the Channel Scroll Bar left and right arrows to change scan direction.
* While you can't control more than one radio at a time with Radio Manager, you can set up different configuration files for different radios.
* Radio Manager automatically corrects search ranges when you reverse the upper and lower limits by mistake.
* The step size is automatically set to last search step.

Bug Fixes
* Fixed the GPF when the Delay button was selected, and no bank file was loaded.
* The first bank with channels is automatically selected when no other banks are selected.
* Frequency displayed when iconized and searching.
* Finally, "Lock-Ups" should be fixed. You should no longer have to press ALT to open dialogs.
* Fixed Look Up unknowns which wasn't always working.
* Switches channels correctly with radios with more than 99 memories.

Version 2.0 (8/30/94) Now supports OptoScan456(tm) by Optoelectronics.
* The OptoScan456 is a new interface for the Pro 2005/6 scanners from Radio Shack. The OptoScan456 decodes CTCSS and DCS squelch tones, as well as DTMF digits. It also reports signal strength. Contact Optoelectronics for more details if you don't have one.
1-800-327-5912
5821 NE 14th Avenue, Fort Lauderdale, FL 33334
* New signal detection methods added.
Radio Manager now lets you choose from Hardware detections methods including Ring Indicator Pin 22, or Carrier Detect Pin 8, or soft ware detection if you've got an Icom R72, R7100, or R9000.
* Common Setups can be saved if you control more than one type of radio.
* Temporary Lock Out - Lock Out a channel for a specified time. The channel will automatically be unlocked after the time has elapsed.

* And a few more bug fixes.

How to purchase Radio Manager for Windows

Radio Manager is a shareware program. This means you can have a copy for free, until you are sure that you like it and want to keep using it, after that you must register a copy if you continue to use it. When you register your copy, you'll get the latest version without the startup dialog box. If you are using the Unregistered Trial Copy and would like to order Radio Manager please choose Order Radio Manager from the Help menu and print and complete the order form as described in the help file. For $30.00 (includes shipping) you'll get a diskette containing the latest version of Radio Manager and Frequency Manager. Texas residents add 7.75% sales tax.

System Requirements:
* 80386 and higher IBM PC and Compatibles with 4MB RAM
* Windows 3.1 or Higher (running in Standard or Enhanced Mode)
* SHARE.EXE must be loaded for Radio Manager to function properly
* A hard disk with 2MB free disk space
en
computer and radio is set to 9600 bps.

I N S T A L L A T I O N for unregistered copies.

To install Radio Manager, simply copy the files in the RM.ZIP file into a directory of your choice. Then create an icon by choosing the FILE|NEW menu item from the Windows Program Manger. Click on the OK button or press ENTER. Complete the Program Item Properties dialog box and press ENTER. See the extensive on-line help to learn how to use Radio Manager. You'll probably need to change items in the OPTIONS|RADIO SETUP menu item that are specific to your setup.

*** If you get a message asking "Is SHARE.EXE Loaded?" when you try to run Radio Manager or Frequency Manager then add the line below to your CONFIG.SYS file located in your root directory. You can use a text editor to change the file. You might need to specify a different directory than the one below depending on the location of SHARE.EXE on your system. SHARE.EXE is included with DOS.

Install=C:\DOS\SHARE.EXE /L:500

I can imagine the parer work the guy had to fill out to get the 5 bucks into the 'WAR CHEST'.

To those interested. Just ask for the address of the neares Red Cross chapter. (nearest to you !!)

And send a donation there !!

The poor on the scene volunteer probably had no idea what to do with the $5.

But thanks BIG TIME !!!!

One drawback to low price is low audio quality !!

Sorry aside from putting a more efficient speaker in the thing there isn't much to be done.

Turn up the volume with just static untill you hear the sound change into a distorted one. That is the max volume.

Forget standing at a fire scene or any noisy place with any scanner because you will not hear it.

Ear plugs (top of the line is the best you can do)

And an external speaker (like radio shacks) will be fine in the car even with the top down.

Hello all!

I am new to this group. I am not "new" to scanning, but have not had the chance to get as involved as I would like. I have recently purchased a pro-51.

Is my understanding correct .... It was manufactured by Uniden? and is the same unit as the BC220?

I would like to modify it to receive more. Can anyone send me the available mods for it. There are no alpha characters in the serial number, and the man date is 12A3.

Thanks! -

AD> Has anyone tried these two scanners side-by-side and compared image
AD> rejection? Both have triple conversion receivers, I'm wondering if the
AD> BC2500XLT is as good as the Pro-43. Thanks...

Well, I haven't compared the 2500 to a '43, but have with a 2004. The
2500 is not very good at image rejection. Occasionally, I will receive
cellular in the middle of the military air band. TV signals are also
possible. I haven't had this problem, but Grove mentioned shortwave
signals in the 400 Mhz band.

BJRL> date. Any type of cellular encryption is most likely not going to use
BJRL> any kind of public/private key encryption, just plain ol' digital
BJRL> audio. How will the new cell phones decode the digital audio? Probably
BJRL> with a soon to be readily available descrambler IC. Magazines will no

Wow!! A double hit!! Not only is someone going to listen to cellfones,
which is against the law anyway, but now they will descramble the signal
to top it off? Hopefully the radio police don't get wind of this one. :)
Yes, someone will come up with a kit. It would be difficult to make these
decoder kits illegal as anyone could say that they want secure
transmissions and that is the purpose.

BJRL> doubt publish do-it-yourself articles on how to use this chip in your
BJRL> own descrambler.
BJRL> Who knows, whatever digital format they use may find it's way into
BJRL> other products as well. I can see the ads now. The New Fischer-Price
BJRL> baby monitor with "CELLULAR SECURITY".
BJRL>
BJRL> What I want to know is, since the radio community as a whole is slowly
BJRL> moving toward digital, will some digital transmission format be
BJRL> defined as "unencrypted"?

This was something that was discussed on CIS a while back. I think there
will definitely be a digital format in the years to come. I would think
that the format will be a standard format that everyone can use and follow.
This format should be made available to the public so receivers and
transmitters can be manufactured to comply with the digital format.

Good post...Jerry

It's my job, every day, to find "breaking" stories for our TV clients and I would suggest the following. NEVER accept what you hear over the scanner; Call the department and tell them that you are calling to varify the following information heard over their frequency (and tell them what you heard). They can varify or deny it and then use what they say. I do remember that the upper courts have upheld that school newspapers have the same rights as the BIG guys. ACt honestly and openly and GO FOR IT!

jackson@longlast.cs.nyu.edu (Steven Jackson) asked:

> ... what kind of fuse should I put in there?

Fuses are rated by their limiting current, i.e. 2 amp. The "250" you saw on the fuse is it's maximum safe voltage, the potential that would appear between the terminals after the fuse blows. Most cartridge type fuses have a 250v rating (a '250 amp' fuse would weigh several pounds and could handle your entire house, plus several neighbors <g>).

On the other end of the fuse you'll find a current rating, such as "AGC2", where AGC is the physical size and the number is the ampere rating. The 2005 is rated at 18 watts on a 13.8vdc line, which means a maximum draw of 1.3 amps (= 18w/13.8v). A 2A fuse is fine for that load. For the H/T, check the specs and choose a fuse rated at 150-200% of the maximum current.

The deficient speaker in the early production of the PRO-43 is a known problem. The replacement 500mw speaker can be ordered from Tandy Natl Parts, (800) 442-2425. Give them the catalog nbr of the scanner, 20-300, and ask for the SP-0228 speaker ($11.89). Also get the service manual, if only for the disassembly/exploded-view illustration.

[The post that mentioned #123 and #127 was refering to the manufacturer's original part nbr, EAS-3P123A.]

The only soldering you'll have to do is the two speaker wires. Since a lot of the PRO-43 mod files describe a disassembly procedure that requires unsoldering the antenna connection, I'm attaching an except from "Modifying the PRO-43" by Howard Bornstein that avoids that. Once you have the top two boards out, the logic board is removed with five screws (there's one in the middle).
/* barry /&

Procedure:
1) Remove the antenna and the battery pack. Then remove the 4 black Philips screws from the back of the case. Put these and all other screws in a secure area.

2) Pull the back case off. The case will separate near the front of the scanner, revealing the stacked circuit boards inside. Place the scanner down on its face. You will encounter three circuit boards. The top board is the one you will see looking directly down. There is a second board in the middle, and the third board is the board that has the keyboard attached to it. The top and second board are connected together and will move as a unit.

3) Remove the six small screws from the top circuit board. Place these screws in a secure place.

4) The top and middle boards are connected at the bottom left by a small black 4-pin connector. Take your small, slotted screwdriver and use it to carefully pry up the black connector at the bottom of the top circuit board. A good place to pry up the board is above the metal shield on the left, bottom edge of the board. Once you lift up the top board by freeing this connector, you can shift the top board slightly to the left and right. First, shift the top board to the right so that the Philips screw on the lower left edge of the middle circuit board is exposed. Use your small Philips screwdriver to remove this screw. You may need to use your needle-nose pliers to grab this screw once it's loosened.

5) Shift the top board to the left so that the screw at the lower right edge of the middle board is visible. Use your small Philips screwdriver to remove it. You may have to angle the screwdriver slightly to get to the screw. The needle-nose pliers may also make it easier to remove the screw. Store these screws with the others.

6) Once both screws are removed from the middle board, the whole unit of the top and middle board will lift out and "fold" over to the left. In order to lift up, you have to disconnect two connectors along the right edge of the middle board. There is a small connector near the top right of the board and a longer one along the middle right edge. Again, use your slotted screwdriver to carefully pry these connectors loose.

I talked with a couple of companies about their software. They claimed it
was 'TAPI' compatible software which used a special TAPI protocol when
you dialed up their system using their own special software.
Didn't look like it was something you could hack up on your own.
Does anyone know about this TAPI thing? specs? anything?

Of course not all the people who go through airport security end up on the planes. When I go to the airport to drop off or pick up travelers, I usually bring a scanner into the terminal and have yet to be challenged by 'airport security'.

And it is really fun to listen to the Passenger Agents, luggage handlers, cabin cleaners, maintenance staff, ramp control, and crew coordinators -- not to mention the airport police and fire departments.

If there is anyone out there who has experience with the ICOM AR-8000 scanner, your input would be greatly appreciated. I am interested in buying a second scanner, and had my heart set on a Pro-2006 until I heard about this one.

I am particularly interested in Rx in the marine SSB bands, but any info would be helpful. You can write me at bartdoug@teetot.acusd.edu, or reply here.

Thanks in advance,

Doug

Tandy's current ad campaign "You got questions, we got answers," is a joke. Probably one time in 10 that I've asked someone in a RS store about a product they sell, have I gotten an answer. Two weeks ago I asked a simple: "Which battery charger does RS recommend for use with your heavy duty battery" and couldn't get an a straight response. The droid spent 10 minutes reading the backs of the charger boxes and battery packages and still didn't know. I got the answer I wanted by looking it up in their catalog! It's always like that. What's worse is that 2 seconds after walking into the store, one of the droids will jump on you with a "Can I help you?" Fat chance.

ICOM does not make anything called the "AR8000". There is a new handheld
having that model name, which is distributed by the Japanese company AOR.
Here are reposts of the specs (thanks to Jonathan Clough) and an early
review.

>I am particularly interested in Rx in the marine SSB bands, but any info
>would be helpful. You can write me at bartdoug@teetot.acusd.edu, or

If that's what you're going to use the radio for most of the time, you'd
be better off getting a portable shortwave set. Scanners like the Yupiteru
MVT-7100 and AOR AR-8000 have adequate sensitivity for HF but need better
antennas than the ones provided, and do not have adequate IF filtering to
combat adjacent channel interference on crowded HF bands.

19 May 1994.

The following "blurb" is taken off AOR's latest (first) information sheet on
the new AOR AR8000 handheld receiver. As of today "sometime in June" is
the anticipated delivery but we are talking AOR here so don't start holding
your breath just yet. Price is also still undisclosed.

Cheers
Jonathan Clough

++
The AR8000 is the result of AOR's long term ambition to produce a new breed
of radio receiver which combined full computer compatibility with advanced
wide-band radio receiver technology. With the introduction of the new
AR8000, AOR have broken the mould of conventional radio receiver design.

At first glance the AR8000 in its static form may look no different to any modern hand-held scanning receiver, but the similarity ends there...just as soon as the receiver is switched on!! Initially you are greeted with the opening welcome message on the AR8000 multi-function liquid crystal display "WELCOME TO THE WORLD OF AR8000 RECEIVER", in a similar way to a sign on message displayed by your personal computer. This new experience immediately demonstrates to the new user and discerning radio listener that the AR8000 is no ordinary radio but THE NEW CONCEPT in radio design. The modern new cabinet design measures approx. 152mm (h) x 69mm (d) x 40mm (w) excluding projections and weighing only 350g including NiCads (but not aerial).

The AR8000 is a highly sensitive hand-held receiver boasting a very wide frequency coverage of 500KHz to 1900MHz without gaps in the range (actual acceptable frequency input from 100KHz). Step size is programmable in multiples of 50Hz for smooth tuning. The all mode reception provides AM,USB,LSB,CW,NFM and WFM. As you might expect from a radio receiver of this calibre, an independent 2.0KHz SSB filter is fitted as standard and the USB/LSB modes use true carrier re-insertion with correctly calibrated frequency read-out (not offset by 1.KHz). A custom manufactured ferrite bat aerial is neatly installed at the top of the receivers cabinet to enhance receive performance when listening in population centres to Medium Wave services or when commentary is provided at aishows and motor sport events.

The highly visibility LCD is of a new dot matrix format which enables many new facilities to be used, many of which have never been seen before especially on a hand held design. Two VFO frequencies may be displayed on the LCD simultaneously, one providing a stand by frequency available for quick transfer (similar to commercial aviation built-in radio transceivers. When frequencies are entered, ALPHANUMERIC comments may be stored along with frequency, mode & attenuator status simplifying the job or recalling and identifying memory channels.

The LCD provides four lines of display so that additional facilities may be provided and displayed at the same time, these include a signal strength bar meter and a band-scope showing band occupancy.

The AR8000 is equipped with almost every conceivable operating feature but operation remains easy thanks to a massive new microprocessor. A total of 1000 memory channels are provided which are divided into 20 banks, each having 50 channels. AOR have chosen to allocate 50 channels per memory bank (rather than the more conventional 100) based on findings that most radio listeners prefer fewer channels per bank but more banks for simplified operation. The AR8000 will search and scan at a very respectable (and fast) maximum speed of approximately 30 increments per second. You may even enter "special" frequencies into memory banks where they may only be recalled by entering a user definable "PASSWORD"....this will stop preying eyes.

The AR8000 is truly a button pushers delight but operation need not be difficult. As well as a comprehensively illustrated operating manual and UK quick reference guide, the AR8000 has two operating modes: NEWUSER and EXPERT. As already mentioned, the multi-function LCD provides many new facilities but the receiver has a few more tricks up it's sleeve. Not only can you connect the AR8000 to an external computer for remote control, you

may connect two AR8000 receivers back-to-back so that data may be copied from one to another (small interface required for remote data access). There are a variety of scan/search commands to link banks, scan by mode, programmable delay scan, priority, auto memory store, step offset and a programmable power save circuit to increase duration of operation from the NiCads.

The mechanical assembly of the AR8000 will be a sheer revelation to any radio engineer. Surface mount technology has been employed throughout the receiver which is constructed of plug in modules. This will ensure the highest levels of performance, reliability and serviceability. The AR8000 will certainly stand out in a constructional beauty contest. Keypad illumination extends to the side panel keys and may be switched in a number of ways. Illumination "permanently on" for mobile operation is possible. A specially selected heavy duty regulator has been fitted to ensure the receiver will continue to operate reliably even with the illumination permanently selected.

MAIN FEATURES
Frequency coverage 500KHz - 1900MHz
All mode reception AM, NFM, WFM, USB, LSB & CW
True carrier re-insertion and specific SSB filter with non offset readout
1000 memory channels
20 search banks
Priority Channel
Frequency Pass
Rotary Tuning Dial
Step sizes programmable between 50Hz - 999KHz in 50Hz steps
Scan & Search speed up to 30 increments per second
Signal Strength meter
Band Scope
Backlit LCD , Keypad & side panel
Battery save facility
Separate controls for volume, squelch & dial
Attenuator
Keypad Beep on/Off
Keypad Lock
Top panel 3.5mm earphone socket
Monitor switch
Password protected banks
Programmable Scan & Search including Free, Delay, Auto, Level & Mode
Select Scan List
Clone (Copy) Data facility between two AR8000
Computer Control
Tape Output
EEPROM memory backup (no battery required)
Supplied with NiCads, charger, Hand Strap, Belt Hook & screws, earphone, seem flexible aerial, DC lead with cigar plug
Comprehensive operating manual with over 50 illustrations & quick reference

SPECIFICATIONS
Frequency Range: 500KHz - 1900MHz

Receive Mode: AM, NFM, WFM, USB, LSB & CW

Step Size: 50, 100, 200, 500Hz, 1, 2, 5, 6.25, 9, 10, 12.5, 20, 25, 30, 50,
100, 200, 250, 500KHz or any multiple of 50Hz upto 999KHz

Sensitivity: 500KHz - 2MHz
SSB by field signal strength
AM by field signal strength

2MHz - 30MHz
SSB 1.0uV
AM 3.0uV
NFM 1.5uV

30MHz - 1.3GHz
SSB 0.25uV
AM 1.0uV
NFM 0.35uV
WFM 1.0uV

1.0GHz - 1.3GHz
NFM 1.0uV

1.3GHz - 1.9GHz
NFM 3.0uV
AM/SSB S/N 10db
NFM/WFM SINAD 12dB

Selectivity SSB 2.0KHz (-6dB) 7.5KHz (-50dB)
AM/NFM 12KHz (-6dB) 25KHz (-60dB)
WFM 180KHz (-6dB) 800KHz (-50dB)

Antenna Impedance 50 Ohm
AF Output (4.8V) 120mW (8 Ohm)
Power requirements: 4.8v NiCad / 6.0V Maganese / 9 - 16V DC external
Consumption: 150mA (nominal), 100mA (stand by), 20mA (Save)

Memory Channels: 50 channels x 20 banks = 1000
Pass Channel : 50 channels x 20 banks = 1000
Scan/Search Speed: Approx 30ch/per sec

++

Thats all I have at the mo.....

Date: Sat, 30 Jul 1994 17:58:56 GMT
Subject: AR-8000 Reviewed Here!
Lines: 332

Dear All,

Thanks for your many requests concerning the AR-8000 review. There seems to be a lot of interest in this radio, so a review seems more than worthwhile.

Sorry for the delay since my promise of doing this review. The original AR-8000 I had turned out to be a pre-production prototype so I decided to wait until I could get a full production model before posting.

I have tried to find an answer to all your questions, but if there are any other requests please feel free to send them in. I expect to have the production AR-8000 for sometime to come.

----------cut here----------

Review of AOR AR-8000 handheld scanner
==========

The AR-8000 is a wideband handheld scanner with a published coverage of 500 kHz - 1900 MHz for the UK (it can actually covers down to 100 kHz). Certain bands will be inhibited in other countries so that the radio complies with local regulations.

The full range of modes are provided: AM, NFM, WFM with the addition of USB, LSB and CW. The SSB modes do not rely on a manual BFO but use a dedicated carrier insertion oscillator like a quality shortwave radio. The frequency shown on the display is the true frequency (not offset).

Here is a run down of the specifications:

Frequency range: 500 kHz - 1900 MHz
Modes: AM, NFM, WFM, USB, LSB, CW
Frequency step sizes: 50, 100, 200, 500 Hz, 1, 2, 5
6.25, 9, 10, 12.5, 20, 25, 30
50, 100, 200, 250, 500 kHz or
any multiple of 50 Hz up to
999.995 kHz

Sensitivity:

500 kHz - 2.0 MHz: by field strength at internal ant.
2.0 MHz - 30 MHz: SSB 1.0uV, AM 3.0uV, NFM 1.5uV
30 MHz - 1.3 GHz: SSB 0.25uV, AM 1.0uV, NFM 0.35uV,

WFM 1.0uV
1.0 GHz - 1.3 GHz: NFM 1.0uV
1.3 GHz - 1.9 GHz: NFM 3.0uV

Selectivity:
SSB: 4 kHz (-6dB), 15 kHz (-50dB)
AM/NFM: 12 kHz (-6dB), 25 kHz (-60dB)
WFM: 180 kHz (-6dB), 800 kHz (-50dB)

Antenna impedance: 50 ohms

AF output (at 4.8V): 120mW (8 ohm) THD 10%

Power requirements: 4.6V Nicad
6.0V Manganese battery
Ext 9.0 - 16V

Power Consumption: 160mA (nominal)
110mA (standby)
20mA (power save)

Memory channels: 50 channels x 20 banks = 1000 total
Pass channels: 50 channels x 20 banks = 1000 total
Priority channel: 1

Scan/search rate: Approx. 30 channels per sec

Appearance and general use

The AR-8000 is neat and stylish in appearance and is distingushed from most other radios by the four row LCD alphanumeric display (more on this in the section below and throughout).

There are three rotary controls on the top of the radio: power/vol, squelch and tuning. The tuning knob is a click-stop type which duplicates the up/dn push buttons on the front panel when tuning. I liked the tuning knob because you can hold the radio in one hand and easily step up/dn the bands using the other.

Four sealed in push buttons are provided down the left side of the case. These allow the LCD back-light to be selected, secondary functions to be selected from front panel keys, the keypad to be locked, and (best feature) the squelch to be defeated so that it is forced open when a weak signal has been found.

The keypad itself comprises 20 rubber-like keys which have a positive feel.

You can power the set using internal batteries (nicads if preferred) or an external 12v dc supply.

A rubber duck antenna is provided and plugs into a high quality BNC connector. There is a 3.5mm "ear" socket next to the antenna BNC.

Selecting frequencies and modes is straight forward. You just type in the frequency and press ENT to change frequency. The mode is selected using the 2nd function key and '7', then the up/dn keys or the rotary knob on the top of the radio.

The minimum tuning step size is 50 Hz.

One nice feature is the auto mode where you can make the radio select the appropriate mode for the band you are on automatically. This can be turned off if required.

When you first start using the radio, it operates in "new user" mode and some of the advanced functions are disabled. However, once you have got the hang of using the radio, you can select "expert user" mode and adjust some of the more complex parameters of the radio. Throughout this review I refer to "expert menus", these are only displayed when the radio is in expert mode.

The radio has a power save facility which lets you run the radio for long periods of time using the batteries as efficiently as possible. When the power save feature is ON, the radio switches OFF then ON periodically to save power. Only the RF circuitry is powered OFF, the CPU and display remain ON. The expert mode lets you alter the delay time (the period of time before the radio switches off after a signal has gone) and the cycle time (the period of time the radio is toggles OFF then ON while there is not signal).

The expert mode also lets you alter factory presets such as the lock detect time (VCO and PLL stablisation time), squelch detect time, the audio squelch detect time and the audio level required to open the audio squelch.

Alphanumeric display

The alphanumeric display has a variety of functions and becomes the main focus for your attention when operating the radio. The display is a dot-matrix type and has wide viewing angle which is at its optimum when the radio is held in the hand during normal operation.

There are two VFOs, both of which are displayed together with the mode and s-meter level. You can swap between VFOs with a push of a button. I particularly liked this feature - long overdue in any scanner.

At least 14 different menus or displays can be shown. At times, the display operates like a small vdu giving you a menu type display. At other times it is a comprehensive status display.

There is an 11 element panoramic (or spectrum) display on the third line) that shows you activity on adjacent channels. This proved to be an effective way of finding active channels nearby.

Memories

One thousand memory channels are provided in 20 banks of 50 channels. The banks are designated "A" thru "J" and "a" thru "j". The lower case memory banks can be password protected. Each memory channel has an address like "A00" or "J23" or "b34".

When you store a frequency in a memory channel you can add a 7 character comment. The comment helps with identifying channels held in memory and is very useful. The process of adding a text comment is easy: you just use the tuning knob on the top of the radio to select a character and the step keys to move the cursor backwards and forwards on the alphanumeric display.

There are a variety of memory editing factilties including copying a channel, moving a channel, swapping channels and deleting channels or banks. A system of menus is used on the alphanumeric display to help you through the steps required.

The password protection involves you entering a 4-digit number rather like the PIN number used with a bank ATM card. You enter the password whenever you want to access protected functions. Operation with the password is optional.

RF and scanning performance

Several IF filters have been provided (see specification above).

AM bandwidth is a bit wide for HF use but after an evening's listening on shortwave, I found the performance was quite impressive. This radio is best suited to listening to major broadcasters and has similar shortwave performance to a Sony SW-7600 or an AR-3000A (I have both radios available here). Performance can be improved by replacing the "rubber duck" antenna with a larger antenna tuned for HF reception and using the attenuator (if necessary) to prevent overload.

I talked to AOR (UK) about the choice of filters in the radio and was told that the radio was optimised for VHF use. Filters that are too narrow can cause signals to be missed if they are slightly off-tune. This seemed sensible to me since I have this problem with my Icom R-7100 which misses certain airband signals which are slightly off channel.

Most controversial is the choice of 4 kHz filter rather than the 2.4 kHz originally planned. I was told by AOR (UK) that the filters are standard parts and that different filters can be substituted with the minimum of effort. It should be possible to change the filter to whatever bandwidth you want.

Bearing in mind the filter, SSB performance is still quite good on HF allowing HF amateur radio and utility signals to be received clearly. Frequency stability is excellent through the use of true SSB.

The scanning speed is one of the most impressive features of this radio. Memory channel scans and search scans operate at 30 channels per second.

There are very few spurious signals from within the radio and strong signal handling is very good. I live 2 miles from a 1 kW FM broadcaster and amongst several strong radio pager signals. I did not get any breakthrough from these signals on nearby bands, even when tuned to the nearby VHF weather satellite band.

The scanning facilities offered from the keypad is extensive and the speed of scanning VERY impressive. It is possible to alter the timings used and the behavior of the radio when new signals are found. By default (from the factory) the radio stops on active channels and dwells for 2 seconds before resuming the scan, but you can alter it in the range 0 - 9 seconds.

The expert menu lets you change 5 scan parameters in all: scan delay before resuming; audio squelch detection (ON/OFF); dwell time on active channels; the S-meter level required to stop scanning; all modes or just the selected mode to be allowed.

Up to 100 memory channels can be "tagged" so that only the most interesting are included in the scan. Memory banks can be "linked" in or out so that the selection of memory channels to be included in scans is very flexible (you can select both individual channels and banks).

One thousand pass channels are provided so that you can exclude channels from scans if you want. The radio will prevent you from entering the same frequency twice by checking to see if the new frequency is within +/-10 kHz of any others already "passed".

A single priority channel (memory channel A00) is provided.

A total of 20 search banks allow you to enter two frequency limits, mode, step size and a 7-character comment. The search banks are designated in the same way as the memory banks: "A" thru "J" and "a" thru "j". The lower case search banks can be password protected.

You can link search banks together (so you could have A, C, H, c, e, i for example).

Once again the expert menu allows you to alter the parameters of the search. You can alter four parameters (in fact equivalents of the first four scan parameters, you don't need to select the mode).

Here is something exciting!!!, the auto store search mode. Auto store operates during a scan and automatically copies the first 50 memory channels that are active into bank "J". This is particularly useful for finding active channels while the radio is left unattended.

RS-232 computer control

The AR-8000 marks itself out yet again through the provision of RS-232 control. I think this must be unique for a handheld. Not only does this radio have RS-232, it has the most extensive range of commands I have seen. It exceeds those offered on the ICOM R-7100 by a long way.

In addition to the normal range of tuning and S-meter commands, a range of frequency scanning, memory scanning and pass frequency commands are provided. This means you can have computer controlled scans at the full speed of the radio.

There are about 40 different RS-232 commands relating to scanning operations. You can control frequency ranges, memory channels, the squelch level and mode, delay and free times. This is unheard of in most radios let alone a handheld - very impressive.

You need a CU-8232 interface unit to connect your computer to the AR-8000. A short ribbon cable is inserted into a slot in the battery compartment and connects the radio to the interface. You then connect your computer through a two-wire link to the 9 way D-type connector on the CU-8232. The interface unit is powered from the radio.

You can also use the interface unit to copy memory data from one radio into another. This is yet another unique feature.

Summary

You only have to look at the range of facilities I have described to see that this radio is a real winner. Time and time again, new and genuinely useful features have been provided. This radio is unique and is hard to beat for value.

Don't take my word for it though - go and see the radio for yourself at a dealer.

Notable features:

Excellent manual written directly in English (not translated).
Range of RS-232 control commands (the best available I have seen).
Alphanumeric display giving clear easy to read information.
Panoramic (or spectrum) display.
Dual VFOs
Password protecting memory channels.
New user and expert modes of operation.
Copying memory data between radios.
Inbuilt ferrite rod antenna for MF coverage

The AOR AR-8000 retails for 449 pounds in the UK and is available from AOR (UK) Ltd., Adam Bede High Tech Centre, Derby Road, Wirksworth, Derbyshire DE4 4BG ENGLAND Tel: 0629 825926, Fax: 0629 825927.

> or an external 12v dc supply.

This has to be 300Ma or more though if you try to use something
other than the supplied adaptor.

One useful fetaure is that when you want to enter a frequncy into
any channel the radio will prompt you to the next available empty
channel which means you cannot easily overite data. You can
overide this and select any channel at which pount the display
will then show you the frequency and alpha text (if any) of you
chosen channel.

> When you store a frequency in a memory channel you can add a 7

> forwards on the alphanumeric display.

Or you can go back and edit the alpha text at a later time. It
would be nice if you could clear the alpha text with one key
stroke though. (or have I not read through the book well enough
yet ?)

Not as good as the MVT-7100 though in the time I've been playing
with one. I have not really tried on AM brodcast but on USB the '
7100 seems better. The first day I had one I plugged in 4.722KHz (
which is RAF Volment weather)...on the '7100 with a telescopic
antenna is was quite clear although the display show 1.5KHz offset
(Ie 4.273.5'ish), trying the same frequency on the 8000 with the
same antenna - not a tweak. I demod this to a customer yesterday
with the same result.

Likewise - seems very good in this department.

> Notable features:
> Excellent manual written directly in English (not translated).

Indeed but I think Richard says he rushed a little and although I have not
read it through myself yet one or two people have mentioned it is a little
misjointed but nevertheless its is imeasurably (sp?) better than
anything the Japanese would have put together.

> Range of RS-232 control commands (the best available I have seen).

Can't argue with that - from what I can gather this interface is a
few months away yet - maybe you have some more info in view of you
connections ? I would guess though that to buy the interface & software
would leave you with little change from 150GBP

> Alphanumeric display giving clear easy to read information.

Yup..

> Panoramic (or spectrum) display.
Mmm.....pretty much next to useless though don't you think,
rather like an ashtray on a motorcycle & I think my chocolate
fireguard has more potential !

> Dual VFOs

> Password protecting memory channels.
Nice :-)

> New user and expert modes of operation.
I can see many "owners" hassling their dealer with "I can't get it
to work" screams of help though...arghhhh...

> Copying memory data between radios.

> Inbuilt ferrite rod antenna for MF coverage
There seems to one or two comments re the ferrite - it seems to
have been causing trouble switching in/out automatically which I
assume has been solved although AOR (UK) haven't mentioned this.
I also heard it mentioned is weekend that the ferrite bar may have been
a cause of problems related to the CPU as it is situtaed immediatly
above the CPU within the radio.

As you say it certainly offers plenty of punches but in the 7/10 days
or so I have been playing around with one my overall impression is
that if you shut your eyes and listen to what comes out of the
speaker the MVT-7100 is still the "better radio", yes the AR-8000 is
very good and has many facilities that people will find very
useful but the audio and performanec is just not quite that of a
Yupiteru but I'm sure the extra features will make up that slight
shortcoming for many people.

If the logic board doesn't has to be repaired most likely you'll get you're
old unit back (w/repaired/replace hardware). If they can't repair it w/in a
reasonable time you'll probably get a non-modifiable unit in exchange.

>MAIN FEATURES
>Programmable Scan & Search including Free, Delay, Auto, Level & Mode
^^^^^

Does the AR8000 have a MANDATORY 2 second minimum delay on ALL channels like the Yupi MVT-7100? Perhaps this will be the last time I WHINE about the Yuki's delay *feature* :-/ but it makes me sick to see it sit around and wait 2 seconds after an active signal has ceased until it resumes scanning. I sent Yupiteru a letter several months ago concerning my gripe although I also praised them for what otherwise is a magnificent radio. I never received a reply from Yupi. Would anyone know how to get rid of the delay or is this in the CPU firmware? I absolutely HATE the delay problem.

Guess I'll quit whining and go home to play with my pro2006 for a while.

> Does anyone know about this TAPI thing? specs? anything?

Of-course it depends on the local pager company. It may be different in
US. In our case they have a standard modem on line. Their software asks
in plain english:
ID=
Enter pager number:
and
Enter alpanumeric message:

That is their whole protocol - all in plain ACSII.

>
>Try looking for a little surface mount resistor that says "103" on it. It
>is about
>1/8 of an inch long...

Is my memory off? I thought that a new resistor needs to be soldered in for the cell mod? I had mine done by the shop I bought it from and all they did was remove the above mentioned resistor. When I did the mod for a friends BC200XLT I remember adding a 1/4W resistor between two different pads per the instructions I had then. Does this add more coverage? And is it possible that the original poster has a non-restorable BC200?

Those who read this and have done mods to the BC200XLT please see my post "Faster scan rate for the BC200XLT".

I went by the Radio Shack today to pick up my free 95 catalog (coupon) and noticed a CB on sale that had a nice looking telescopic antenna with a TNC connector on it. I told the RS guy that it would be nice to have the antenna since it would surely outperform any scanner antenna they had, including the $9.95 model (20-006) with the center coil. He told me he would sell it to me and order a replacement from Tandy Parts. I bought it for $20 and a TNC/BNC adapter to go with it. The bottom line is that it works MUCH better than the other center loaded whip (20-006) on the 30-54 MHz band and I can't wait to get it home and see how it does on shortwave with my Yupi scanner!

If you're interested in the antenna, ask for a replacement whip for the TRC-226 40 channel CB (21-1665 - 1994 catalog only).

>have any other recommendations at that price range?

That sounds like the Sportcat. I don't know much about it but I think
you can get it for under $249. As far as the Radio Shack scanners, the
reason you didn't find one you liked may be because RS has recalled
most of them :-) The Pro43 is a good choice for a handheld but you may
have to pay between $300 and $350 for it. If you want cellular
capability you may want to find one manufactured with a date code prior
to 4A4 (April 94).

Another option that works nice on low band is the VHF dipole that RS sells for TV sets (15-235 on page 104 of 1995 catalog). You can get the 300 to 75 ohm adapter (15-1253 on page 107) and the F to BNC adapter (278-251 on page 109) and you're in business. The antenna opens up to 8 feet (about 65 MHz wavelength) and works great for the 30-54 band. You can shorten the dipole length for higher freqs. I've found it to be VERY directional on VHF freqs and useful for direction finding on those interesting cordless freqs :-) The antenna is a bit more cumbersome to use than the CB antenna I referred to in the previous post.

Source record: 268657

I know very little about scanners and I have to find a hand held scanner for my boss $200-$300 range. Most bang for the buck. Also one that can be modified to scan 869-896mhz.

2431. Pro51 birdies (a few found)

Newsgroup: rec.radio.scanner
Date: 1994-09-16 20:11:50 UTC
From: horak@convex.com
Message-ID: <35cu66$28d@eugene.convex.com>
Source record: 268658

I got curious and opened up my Pro51 today (at an ESD safe workstation :-) and it is incredibly easy to take apart. If there ARE hardware mods, they should be easy to complete (my unit is a 11A3 date code). I wouldn't mind getting rid of the BEEP! Anyway, I don't have a schematic but I did notice a 10.35 MHz crystal piggybacked on top of a logic board (directly behind the date code on the back cover). I noticed while playing with the search function that each birdie I found was a multiple (harmonic) of the 10.35 crystal.

10.35 MHz crystal =

31.05 MHz
41.40 MHz
51.75 MHz
113.85 MHz
124.20 MHz (Weak signal but search DID stop on frequency)

The frequency of 134.55 MHz did not seem to be affected at all.

They are still pretty findable in the Dallas area. When I decided I wanted a second one, I found it in the first store I tried (covered with dust...) at $15. The sales person may not recognize what you are talking about if you call it a radio, though. It's more likely described as a video game accessory (which was the way it was marketed)...

These are pretty useful, if limited in range, for this price...

The factory default in "new user" mode is 2 seconds. Once you activate
"Expert mode" you can change the delay from zero to 9.9 sec. It cnanot be
changed on a channel per channel basis, or on the fly.

Hi all! I'm new to the net and to scanning. My son has a Uniden 10 channel scanner he got as a gift a couple of years ago. I found it in the bottom of his closet about a month ago and started playing with it. I started reading this newsgroup around the same time. The bug bit me and I got my PRO2006 last Saturday. All I can say is WOW!! If you are debating about getting a 2006 then I say just get it. You won't be disappointed.`

Now a couple of questions.
What's a good range to search for military air. There is an AF, Air NG, and and Army base within 30 miles of my house near Columbia, SC. I got the RS discone antenna when I got my 2006, so I should be able to pick these up. Everything else is loud and clear!

If I do the scan speed mod, will I still have a high and low scan speed? Will the speed button still work?

Thanks. Please post or E-mail.

P.S. My wife loves the cordless freqs. Kept me out of the doghouse when she asked how much my new toy cost.

>Does anyone have a AR-8000 for sale, or know where I can get one?

I got mine from Jonathan Clough at Javiation in the UK. The final cost
was 395 pounds plus 34.14 in duties. You can reach them at:

Javiation: 011.44.274.732146
100117.535@compuserve.com
clough@javiaton.demon.co.uk

Supposedly a number of US vendors will be getting stocks of the US version
in the next few weeks. You could try EEB (800.368.3270) or Grove
(800.438.8155). The only significant differences are that the US version
will have the default mode programmed according to the US band plan; and
of course, the US version has the cellular frequencies deleted.

-=> Quoting Bob Wright to All <=-

BW> I checked at all the ftp sites that I know of, but couldn't
BW> find the mods for the pro2032.. Any help??
BW>
BW> The 2032 has lousy (i.e., nil) image rejection. Is this true
BW> for the other RS scanners (except for the 2004/5/6)?

The 2032 is a double conversion unit and may not perform as well as a
2004/5/6. Doesn't surprise me that it has an image rejection problem.
Most double conversion units do.

Product...Realistic PRO-2032 by Radio Shack
for units with date codes 4A4 and under
Purpose...Modify for continuous 800 Mhz coverage
in appropriate 30 Khz steps where applicable

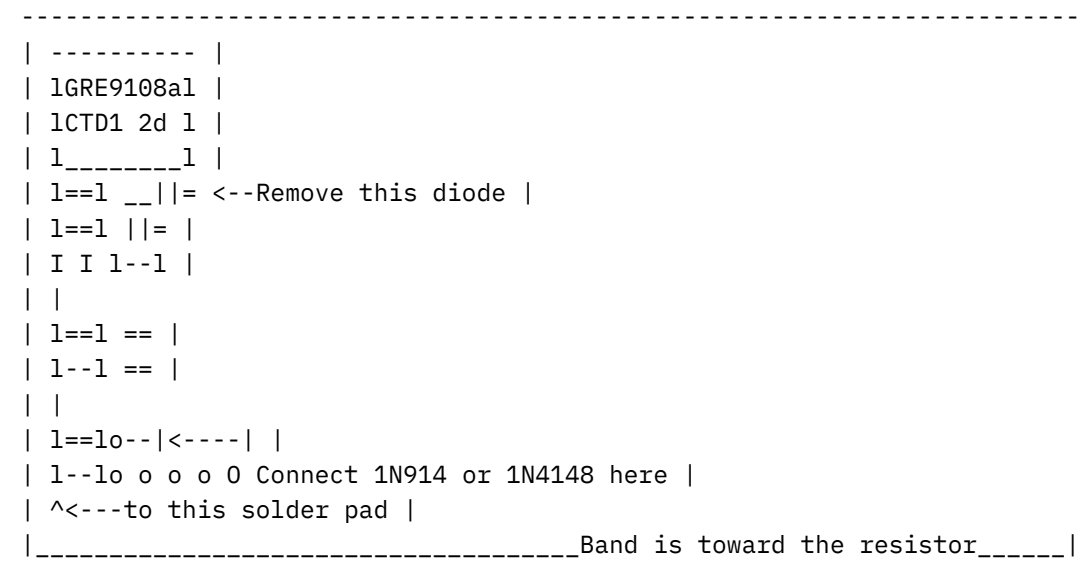
Updated 7/94

** This modification is only valid for units manufactured before 4/94.
** Disclaimer...All modifications are done AT YOUR OWN RISK.
** Performing this modification may void your warranty.
** Perfroming this modification may enable certain portions of the 800 Mhz
band that is illegal to monitor under federal U.S. law.
** I strongly suggest taking ESD precautions by getting a static strap as
this involves work with static sensitive devices. Any electronics store
should have one for purchase.

This information is from the June, 1994 issue of Monitoring Times, p.
112.

Required equipment...small-tip soldering iron, small gauge rosin core
solder, desoldering wick, Phillips screwdriver, 1N914 or 1N4148 diode.
1. With the scanner unplugged from power, remove both upper and lower
covers (foru screws in the rear of the cabinet), taking care not to damage
the speaker wires.
2. Set the scanner upside down with the back facing you. Locate the
microprocessor shield (upper left corner near volume and squelch controls).
Unsolder and remove the shield.
3. Refer to the diagram and locate the three-legged diode at the lower
right of the microprocessor chip. Carefully unsosolder and remove this
diode.
4. Referring to the diagram, place a 1N914 or 1N4148 switching diode
across the solder pads as shown. (NOTE POLARITY) Remove any excess leads
and carefully solder it in place. Be sure it's leads will not contact any
other components, paths or the reassembled shield. A small piece of tape

may be used as insulation if necessary.
5. Plug the scanner into power, turn it on and test the unit by entering
any frequency that may have been blocked in the 800 Mhz range.
6. If successful, unplug the unit and reassemble the scanner.



Jerry

2450. Help: Regency 1040 scanner

Newsgroup: rec.radio.scanner
Date: 1994-09-17 03:21:55 UTC
From: rbn@apple.com
Message-ID: <35dncj$9rr@apple.com>
Source record: 268540

I picked up a Regency 1040 scanner recently. It accepts a frequency into the VFO with no difficulty, but when I attempt to write that frequency into a memory channel it doesn't take...when I switch from manual to scan, the stored frequency isn't there.

I suspect the channel RAM is bad...but before I open up the radio (I don't have a schematic), I thought I'd ask about it here...does the 1040 have a discrete RAM chip, or is it part of the CPU? My guess is the former, since the radio (a) allows frequency entry and (b) scans like it's supposed to...it just scans whatever garbage it finds in channel RAM. If there is a RAM chip, what is it?

Right now the radio is a cheap li'l 1-channel receiver with no frequency backup on shutdown...but I'd really rather it be a 10-channel scanner with a row of blinky lights (I've owned many scanners, from a Regency M-400 to a Yupi 7100... but never one with a row of blinky lights!).

> fuse, he replied, "yeah, sure, that should be just fine..
> have a good day."

Well, yes, it should be.

The voltage rating on a fuse is like that on a capacitor -- you can use the fuse in lower-voltage circuits without problems.

As for the current rating, it should be about 1.5x to 2x the rig's maximum needs. 1.5x for slow-blow fuses, 2x for fast-blow.

What about their dreadful habit (here in the UK, anyway) of asking every time you go in for a resistor for your name and address. "Just so we can send you a catalogue, Sir!" I have *never* been sent anything by Tandy, and now refuse point blank to play ball. In fact it is so irritating I hardly ever use the shops now.

rOWLEY.

I have a Pro51 with the antenna it came with. What exactly would I gain if I would switch to a different antenna? The local RS droid said none. He also didn't know why the 51's were pulled from his store either (and was surprised to find out).

I'm just looking for a better _portable_ antenna, not a house-mounted one.

Thanks!

> she asked how much my new toy cost.

I've yet to do the speed mod on mine, since it only results in a 13% speed up. I've also haven't done it, since if I don't like it, the diode is wedged in that hard-to-get corner in the back of the front panel. A bit difficult for me to get back in there with a soldering gun. I did do the 800 mhz mod, and that works perfectly.
But people who have done it, do say the 'speed' button still works, but at proportionally higher speeds. Also, the 'delay' button still works too, but the 2 second delay is 13% less, so it is still useful.

I agree that this law is the applicable one here. Of course a newspaper might take a chance and then use some kind of a "protecting our sources" argument, not ever revealing that the information was over heard on a scanner. A real newspaper might have the resources to defend themselves that way. I don't know if a school paper could get away with it.

Would it be feasible to use one of those headphone out-to-cassette adapters used by people with portable CD players? My thought is to put it in-line with a stereo to mono jack first.

2462. PRO2006 w/Opto456 & 6400 Channel Mod?

Newsgroup: rec.radio.scanner
Date: 1994-09-17 19:26:55 UTC
From: lancecr@netcom.com
Message-ID: <lancecrCwAGov.40o@netcom.com>
Source record: 268576

I've recently purchased a Pro-2006 (from my local RS no less) and I'd like to do the 6400 channel mod. I'd also like to add the Opto456 Computer Controller later.

My question: Are these two mods compatible?

I understand the memory mod well enough, but it looks like it involves adding a board with the new SRAM on it and I'm wondering if this will confuse the Opto456 in any way. Does anyone have a Pro-2006 with both mods installed?

Thanks for comments!

JJ>.du.edu>
JJ>Newsgroups: rec.radio.scanner
JJ>Organization: University of Denver, Dept. of Math & Comp. Sci.

JJ> I recently read a posting about Celluar Freqs Modification for a
JJ>Uniden BC200XLT.
TRY THIS--This is an OK Mod...
Uniden BC200/205 Business Band Restoration
-------------------------------------------------------------------------

Prior to performing this modification take the following precautions to insure
that damage does not occur to any component inside of your Uniden scanner.

A) Try to perform the modification in a low static electricity environment.

B) Avoid wearing wool clothing or walking across a carpet (in low humidity
areas) as well as touching your scanner or any component inside the
chassis.

Required tools: A small phillips screwdriver and a fine-pointed snipping tool.

MODIFICATION PROCEDURE ----------------------

1) Disconnect the antenna and slide off the battery pack from the scanner.

2) Remove the two screws from the back of the scanner plus the two screws that
hold the battery pack retaining spring in place as well as the spring
itself.

3) Carefully pry the bottom of the rear of the cover from the radio then
remove the cover.

4) Locate the two small screws at the base of the circuit board and remove
them. Gently pull the front panel from the mainframe at the BASE (the two
halves are connected by a plug so their will be some resistance) and
separate them.

5) Consult the illustration below and locate the IC labeled "UNIDEN UC-1147"
and the 10K chip resistor positioned above the letters "DEN" on the
integrated circuit. (The resistor will be color coded brown-black-orange).

+-----------------------------------------------------------+
| BC200/205XLT PC Board |
| |
| (Speaker) [] <------10k Chip Resistor |
| |||||||||||||||||| |
| - UNIDEN - ||||||| |
| - - - - |
```

6) Using the small wire cutters, cut the resistor in half. (Be careful as the resistor may shatter causing debris to scatter along the PC board). Be sure to remove all left over residue by blowing or brushing it away. The solder pad that the resistor was soldered to may peel up as you remove the resistor. You may peel the pad off if done carefully not to disturb the surrounding area or components.

7) To reassemble insert the top of the front panel into the slot under the volume/squelch control panel while noticing the alignment of the dual in-line connector at the bottom of the board with the mating socket and finally pressing it (the front panel) in place. Be sure that the holes in the PC board line up with the holes in the plastic standoffs under the board.

8) Insert the two screws and gently tighten. Replace the back cover by inserting the top of the cover into the slot under the volume/squelch control panel. Press the cover into place, insert and tighten the screws. Replace the battery retaining sprint with the slotted side facing the notched hole. Insert the two remaining screws and gently tighten them. Slide the battery pack into place and switch the scanner on to make sure the display comes on. If not, check that the battery is charged and/or the battery retainer spring is properly mounted or dual in-line connector was misaligned during reassembly. Assuming the modification and the reassembly was successful, switch the scanner on, press manual, 845.0, E and within a couple of seconds you should see the frequency 845.000 MHz displayed. The modification is now complete!

Try it it is very easy to do.....

SC> Bearcat models. I tried one out and it seemed good enough for me. I
SC> forgot what model it was but it was yellow. The store I went to was
SC> selling it for $249. Is that a good price? Does anyone have any other
SC> recommendations at that price range?

Hi, Steve...Welcome to the group. :)

The yellow scanner is only one manufacturer and model. The Uniden
Bearcat 150. Wal-mart here in IL had them on sale for $200 when they first
came out. Uniden also sells a 220XLT that is excellent for the price. RS
has a Pro-43 handheld, their top of the line at a top of the line cost. RS
also sells several others but have been temporarily pulled off the shelf.
These are the Pro-51, Pro-46 and Pro-23. Grab or scam a RS catalog
($2...cheaper if scammed) and check out some of the models in there. There
are several new offerings coming from them.

>like the Yupi MVT-7100?

The AR8000 allows you to independently set the search and scan delays between .1 and 9.9 seconds. It will also take a value of 0.0 for no delay and HOLD for an infinite delay. From my limited reading of the manual, this parameter is global in nature so you can't set it on/off for individual channels like you can on a Uniden or GRE scanner.

> Thanks!!!

To the best of my knowledge, the RS PRO-2006 has been discontinued,
and any place you may still find it for sale, is just selling any
remaining inventory. There are no 'new' 2006's that are being
introduced.
All PRO-2006's should be modifiable. I just purchased one, and I
modified mine. Radio Shack's successor to the 2006 will be the
PRO-2035. This model shouldn't be modifiable, to conform to U.S.
law. I say shouldn't, since it won't be out until next month.
But who knows... Once it's out, there may be someone out there
who buys one, takes it apart, and figures something out...

You might want to contact Icom at 1-206-454-7619. They don't seem to have a phone number for Guam. I suspect they can make the manuals available at typical Icom prices. The above number is their "customer service" number.

They have another number in southern California (the above is in Washington state): 1-714-852-8026. And in Oz: 03-529-7582.

I had the same question about the cell-freq mod. I called OptoElectronics directly, asked for tech support, and the guy I talked to said that there was no problem with the CELL mod working with the OptoScan456. It took about five minutes to make the call, and then you'll be guaranteed to know weather of not the 6400 freq mod works with the OptoScan456.

As a side note, I'd like to see a mod that will enable me to upload and download freqs to the scanner. It would be nice to have all the freqs I have in one database, then, let's say I go DC for the weekend, so I just upload the DC freqs into the 2006 and go to DC without having to drag along the PC or having to hand-enter all the frequencies.

2481. PRO-51 Mod: Removing Beep

Newsgroup: rec.radio.scanner
Date: 1994-09-18 02:57:45 UTC
From: moy@xp.psych.nyu.edu
Message-ID: <9409180302.AA03672@xp.psych.nyu.edu>
Source record: 268581

Hello fellow scanbots,

The following describes how I modified a PRO-51 to get rid of that awful beep. With this change, you won't be able to hear the low battery warning, either. I came up with this independently after failing to discover anything on the PRO-51 in the net.archives.

This procedure should void your warranty and may wreck your radio. Neither I nor my employer assume any responsibility for any damages you or anyone else may incur from this information!

==Radio Shack PRO-51 modification to remove !!BEEP!!==

This change was performed successfully on a unit coded "11A3." The CPU in this unit was marked "Uniden UC1581." Use the following information at your own risk!

Orientations are with the set flat on a work surface, LCD display facing down, with antenna BNC and knobs facing away from yourself.

As with any electronic instrumentation, remove all power and take all necessary precautions to prevent damage from electrostatic discharge (ESD).

CAUTION:

Be aware that parts of the circuitry will *still* be powered! There is a capacitor on the digital board that keeps the channel memory alive. This capacitor may contain enough energy to damage the electronics should a short occur.

Opening Case

Fortunately, this set is very easy to open. Open battery compartment and remove batteries. Remove four screws: two straddle the sticker on the back of the cabinet, two others at the upper part of the battery compartment. There are two small plastic detents at the floor of the battery compartment. They are directly downwards from the "-" and "+" legends, which are molded on an extension of the removable back. These detents will need to be unhitched to allow the back to separate from the front. Pull back off gently.

Remove RF board

The RF board is attached to the top panel, which contains the volume and squelch controls and the antenna connector. At this point, the board is essentially free and will separate from the

rest of the set when the header connector at the lower right is pulled apart. This header provides electrical connections between the two boards. Lift the RF board straight out, exposing the CPU board.

Remove shield from CPU board

The metal shield is held by four screws. The same screws also fasten the board, which forms part of the keyboard, to the front of the case. Remove screws and lift the shield straight out. Remember the correct orientation of the shield. Do not allow CPU board to come out of case. DO NOT drop any hardware on to this board, nor allow the shield to contact any of the components.

Cut circuit trace

The ASCII diagram below illustrates the area covered by the lower right corner of the shield that was just removed. Cut the trace that leads to the center one of three plated-through lands. Take care not to damage any components or other traces. Do not put excessive force on board. Remove any metal particles before re-assembly.

2482. Re: CTCSS for Pro-2006?

Newsgroup: rec.radio.scanner
Date: 1994-09-18 03:08:16 UTC
From: az342@FreeNet.Carleton.CA
Message-ID: <CwB21t.Hus@freenet.carleton.ca>
Source record: 268582

In a previous article, steven.barrow@canrem.com (Steven Barrow) says:

>Is there anyway I can modify my Pro-2006 to decode/ignore the CTCSS
>that the OPP (Ontario Provincial Police) use without effecting any
>other scanner fuctions?

If you look in the 1993 version of the "Haruteq Scanner Book
(Ontario Edition)" on page 155, there is a diagram of the modification
needed to ignore the PL tones for the Metro Toronto Police Department.

This will also work for any other PL tones.

You MUST be quite experienced in electronics to do this as it requires
quite a bit of extra parts and soldiering. Your best bet would be to
take the schematic to a known electronics repair shop to have it done.

If you don't have a copy of the 1993 edition of the book, E-Mail me
and I will send you a photocopy by snail-mail. Any other inquiries welcome.

Happy scanning!!

Hi, could some person from America help me find the FAX
numbers to some American Companys.
The reason why I am asking here, is because I dont wont to
spend money on a toll call from New Zealand to a Company in America,
to only get their FAX number. Local Telecom assistance advises
I ring the companys and ask for the Fax number because the companys
usually dont have a FAX listing, So......
here they Are:

Bel-Tronics,LTD.
8100 Sagl Pkwy.
Covington, Georgia 30209
800-341-1401 USA
800-268-3994 Canada

Cincinnati Microwave, Inc
5200 Fields-Ertel Road
Cincinnati, Ohio 45249
800-433-3487 USA
800-667-5452 Canada

Valentine Research
10280 Alliance Road
Cincinnati, Ohio 45242
800-331-3030
513-984-8900

Any help regarding the above companys would be much appreciated,
Just a reminder, I am after their Fax Numbers.

Thanks in advance.

Toby Te Rupe
44a Karaka Street
Hamilton
New Zealand.

OAK.OAKLAND.EDU has RADIO MANAGER (rm.zip)

This is the software that I want to try when I get my 456.
It has a sample file included that lets you see how this thing
works. Also will decode tones, etc. I think it will let you load
banks of frequencies from the computer to scanner also.

I wish some people with the OPTO456 can tell us more about this team:
(opto456/radio manager for windows)

I think it's in pub/hamradio at oakland.....scan away...

I am not the type of person who sits down in an easy chair and
reads docs for a program. With that in mind...

An Unbiased Review of Radio Manager as it works with the OS456.

At first glance, Radio Manager seemed to be exactly what I needed to
finish off my shack. Finally, I'd be able to control my scanner with
my computer WHILE working on the computer in Windows or OS/2.
(I switch back and forth depending on what I'm doing).

The interface appears fairly straightforward, until you start to
work with it. There are a few peculiarities with the interface, it
seems intuitive, but it doesn't always act that way. But, don't let
that dissuade you, remember, I didn't read the docs.

The program is processor intensive... so, don't try running any
heavy-weight programs in Windows and expect them to run efficiently.
In fact, Radio Manager made File Manager run sluggishly. (With
20 Meg Ram in my computer, I doubt is was tied up trying to manage
memory.)

Pick up the latest copy of Frequency Manager (a companion program that
makes Entering Frequencies into Radio Manager alot easier.)
I had a devil of a time finding it on the Internet, so I finally
brought out one of my several 10-hour free AOL trial membership
packages and got Frequency Manager off of AOL.

I have not YET been able to get Radio Manager to work under OS/2.
I'm still fiddling around with session parameters, and I'll let
y'all know when I get it working under OS/2. (And probably a
review of how much better it runs under OS/2... <grin>)

Radio Manager supports uploading/downloading to scanners that
support uploading/download. THE OPTOSCAN 456 DOES _NOT_ SUPPORT
UPLOADING/DOWNLOADING, so, you can't do it.

All in all, I like Radio Manager alot more than the software that came with the OS456. I sent my registration check in for it, and I hope that BSaladino will continue to improve on an excellent product.
Remember, there used to be a MS-DOS 2.01....

Later,
Paul

A tad more portable (at 12") is the 'Condor' from Austin Antenna. They manufacture antennas for the public as well as a variety of government agencies and their products are top notch. The 'Condor' is flexible like a rubber ducky, but has tuned 1/4 wave elements for high band VHF, UHF and 800 mHz. I have been *very* happy with the results I've gotten with mine on my PRO-43. For decent low band VHF reception, you simply need a longer antenna. I use Austin's 'Spectra' w/the pole mount with my 2006. It stands inside the house (in a corner on the second floor), yet I get excellent results. Austin's products can be ordered from Radioware (800-950-WAVE). The 'Condor' is $28.49.

happy DXing & 73's,
Sandy

> she asked how much my new toy cost.

Hmmm... You didn't 'really' have to tell your wife that you just spent what would have been your children's inheritance on your PRO-2006. You had a couple of choices here. You could have lied about what you paid (eg. "Radio Shack was selling out their last ones of these for only $50.00!"). But that would be risky, since she could have easily found out the prices. Better yet, tell her you were day-dreaming of a new scanner while mowing the lawn. All of a sudden you look up in your tree and see a box. You quickly climb up it and get the box. When you open the box, you can't believe your eyes and see this brand new, top-of-the-line, RS PRO-2006 inside! It must have been scanners from heaven. Or tell her an airplane must of dropped it out of the cargo hold while flying over your house. Using this excuse should keep you out of the dog-house when you tell your wife. She'll either immediately leave you after this, or more likely, won't say a thing, being more concerned about this sudden onset of mental illness that it looks like you have.
...Keep me inform on how it goes.

>salesdroid, and has to admit the fact they they are a RS washout.

No need to be insulting there, Dave. I've worked for RS for 18 months.
I've also been running my own broadcast engineering company since 1991,
and have been employed in broadcast engineering since 1977. I have 2
FCC commercial licenses and an Amateur ticket.

RS employees receive enough training to answer the questions of about
99% of consumers. Then there's the 1% who, having no other pressing
duties or obligations (like, for example, a life), come into the store
to baffle the salespeople and amuse themselves. I enjoy them...because
I can usually sling the techno-babble right back at them and leave them
more confused than they were hoping to leave me.

I'll grant you that there's a small percentage of people at RS who would
be better off working at McDonald's. But I really hate generalizations.

 SLMR 2.1a I don't have a solution, but I *do* admire the problem!

>Can cell be restored?

False. There were 4 scanners which, if sold, results in a fine from the
FCC and immediate firing of the salesperson. As the stuff in the flyer
was selected to go on sale about 6 months ago, and those scanners were
recalled about a week after the flyer was printed, not much could be
done about changing the flyer.

: I'm budgeting about $300+/-. Any suggestions, comments or anything?
: Dusty

The advice you got is absoultely right about the radio shack pro
2006. It is a killer scanner. i picked one up yesterday for $325 at my
local radio shack. The scanner has been discontinued for legal reasons
but there are still some available. It will probabally be the last one,
so you can tell them you want 10% off because it is most likely a display
model. that is what I did, and got a brand new one.
As for all the posts about being able to mod the scanner: the mod
is the easiest mod I have ever done, and it works flawlesly. Brand new
scanner (pro 2006) and the mod gives no problems. All you need is a
philips screwdriver and a little tiny wirecutters or even a fingernail
clippers for that matter. It took less than five minutes. The way i
look at it was if the mod didn't work, I would just have taken the scnner
back to rad shack for a refund as defective. (I hate that company, being
an x-employee.) Just behind the top right of the keypad you will find
two diodes. Clip the bottom one to open up freq conerage in the 800 mhz
band. To get to it you just remove two screws on the back and slide off
the top ... watch out for wires connecting top mounted speaker... it is cake.
As for the scanner itself, it is great. This is an upgrade for
me from the pro 34 i have had for a few years, and the pro 2006 hears a
lot more, I mean a lot lot more! god luck with your decision, and being
able too find a 2006 b4 they are all gone!!!

I once went into the Rat Shack in Lenox Mall in Atlanta, (all the ones here are awful, unlike back in Melbourne, FL, where some of the employees are even hams...) and I wanted to buy a 1/8 inch stereo plug and jack to use as a quick-disconnect power connector. The sales droid asked what I was doing, and I told him. He then launched into this spiel about how I could not run battery power through an audio-type connector. "Why?", I asked. "Well, these are for earphone signals, not electricity." As I was trying to keep from busting out laughing, I asked him what the difference between earphone signals and electrical signals was. "Well, ummm... the earphones aren't electrical, and that plug was not made for electricity." I tried to explain that the earphone signals were just oscillating electricity, but he just gave me a blank look and said something like, "Well, I don't think that's right..." I just told him to go read one of the "Now Your Talking" books behind him, and to tell his manager that it might not be a bad idea to go back to the "The Customer Is Always Right" philosophy.

I did not buy the connectors.

> Jerry
>
jerry, I don't know what area you are in but I have placed my 2500 next to my 2006 on the same antenna (splitter) and the 2006 sits quietly by scanning all the while my 2500 is picking up traffic. The 2500 even picks up the city PD portables, the 2006 has trouble picking up mobile units. Antenna is RS discone with VHF element added.
I have also been trackside (railroad) with others who own Pro 43's and my 2500 beats them also. Not as convincing as using the same antenna, but...

yes it does have problems in high rf areas but when you can't hear the transmission it dosen't matter how selective your scanner is. You must get the signal first in order to listen to it.

All of this dosen't even take some of the other features of the 2500 in to account. Don't be too hard on the 2500, it is a good radio, and what scanner out there couldn't use some improvement.

Welcome to the hobby !

WIth the 2006, try 225 to 400 mhz at 50khz steps am mode.

There will be some birdies but my 2006 sound sensing works great on those.

If you hear something but it is reall distorted, hit mon and then try WFM
or NFM.

Ive stumbled across AF1 a few times like this.

About the shuttle.

The only time you can hear the shuttle crew is during EVA's and even then
only when they are over head. It is a big planet.

If you have NASA SELECT on you local cable system. watch it for the screen
that shows where they are and where they are going.

If you local cable company doesnt.. ask them why !!
It's free and on satellite S2 chan 9 (or transponder 5) 365 days a year
and is really fascinating

steve

ps : for the wifes beneifit.. have you accidentally broken that diode just
behind the 3 button. If it should happen you will joind the rest of us in
being a criminal and listenning to cell phones.

have fun

>
>Does anyone have any experience with Trident scanners? They are
>being marketed by Ace Communications via ads in Popular Communications.

Trident is just another brand name tacked onto scanners made by Nissei.
ACE Communications used to sell some of them under the AOR brand, until AOR
revoked ACE's US distribution rights. In other parts of the world they are
sold under the names Camnis, Fairmate, etc.

Nissei-manufactured scanners have had a checkered past. They are often high
on features but have been plagued by uneven performance, poor quality
control, terrible documentation, and arcane/complicated user interface.
Also they do not license the Uniden/GRE patents which would allow such
features as center-channel detection during limit searches, and scan delay
selection by channel; as well as much easier programming.

Still many people (including myself) have owned and used them, and many
like them for what they are. I still own an AR-1000 (I think this is the
Trident TR-1200 now, the ad isn't in front of me) which is rather deaf
compared to the Yupiteru or AR-8000 but it's a good standby. The TR-2400
(Camnis HSC-050) is probably the best they've made so far but is also
imperfect. {The AR-8000 is =NOT= manufactured by Nissei and hasn't yet
shown up under the Trident name, so I exclude it from this discussion.]

>I was just wondering if they are any good or not, and if anyone
>knows if they are modifiable to open up the cellular.

They're "ok" if you get a good one. Each model has its quirks and
strengths.

No Trident scanner now sold in the US will receive cellular frequencies or be
reprogrammed/modified to do so. You can be certain that after having big
fined levied on them by the FCC that ACE made =sure= of that.

ROTFLMHO. [Newbie Translation: Rolling on the floor laughing my head off]

I hope that this isn't a statement about the current problems we're
having in the U.S. with education.

In any case, I miss living in a large city, where there were actually
alternatives to going to Radio Shack. Mail-Order is fine, but when
it's 7pm, and you NEED a connector to continue your current project,
it is nice to know that Radio Shack is there, a few miles away.

I just wish they would put the electronics parts in the FRONT of the
store so I don't have to so far to go while trying to avoid the
salesjerks lurking in the aisles.

Later,
Paul

>73s de KE4ITL

It may be one of the most useful tools, but it's just that only a tool to get you to the story. I've been in Broadcasting 8 years, both Radio and T.V., and i've developed a friendship with many of the local law enforcement officers in town. Many of them know how you find out about what they are doing, and accept that, but you had better clear it with them first on what you print (broadcast). And as said before, The COmm Act of 1934 makes it illegal to use what you hear on a scanner (except ham and broadcast traffic) in print, conversation, or money making schemes.

The best thing to do is to call the department, get a copy of the report and schedule an appointment with the arresting officer, any of that information is public, but nothing you heard can be used in the story.

In the case of O.J. and other times when traffic has been re-broadcast, well it's just plain old bad judgement by some overly big news department thinging that they have the right. Even though the law forbids it. One of those "yea, so what it's illegal, try to stop us, well give you so much bad press, tie it up in court for years, and never let you live it down, it ain't worth it for you to try to stop us. We're god's own tie to the public, we're the media."

SB>Would anyone have plans for a 46.0 Mhz directional antenna? I am
SB>trying to pinpoint the cordless phones in my neighborhood.

Well, you could build a dipole and use it horizontally....
A better way might be to listen to the handsets - especially if you have
a handheld or can drive around and listen for the handheld.

If you listen long enough, you'll be sure to hear a name. People like
pizzas, make appointments, etc.

Directional antennas don't work too well on cordlesses, especially if
they're near you. The quarter wave length of the antenna is 5 feet. A
dipole would be 10 feet long.

VHF/UHF Direct Entry Programmable 200 Channel Scanner Radio

This programmable radio is in excellent condition, yes fully functional. It brings you the most exciting listening of all - local events as they happen, not just hours later through an edited newscast. You'll hear police and fire departments at work, ambulances, amateur radio, weather, Amtrak and freight trains, taxis, plus government, military, marine, and business services, aircraft and much more.

You'll have keypad access to over 23,000 frequencies.

Features include:

o Ten 20-channel memory banks
o One 10-channel monitor bank for temporary storage and priority freqs
o Rapid transfer from Monitor to Permanent Memory
o Large multi-purpose LCD shows which channels and frequencies are being scanned, monitored, programmed, as well as the status of the channel and operation mode of the PRO-2021.
o Provides optional two-second delay to eliminate missed replies on any channel.
o Holds memorized frequencies with internal 9-volt battery backup
o Covers 30-50 MHz (VHF Lo)
50-54 MHz (ham radio 6m)
108-136 MHz (aircraft)
138-144 MHz (government)
144-148 MHz (ham radio 2m)
148-174 MHz (VHF Hi)
380-450 MHz (ham radio and government)
450-470 MHz (UHF Lo)
470-512 MHz (UHF Hi)
o Built-in internal speaker
o External speaker jack
o BNC external antenna connector
o 120-volt AC operation with power cord
o 12-volt DC power jack for automobiles and RVs (negative ground)

Mobile mounting bracket can be purchased at your local Radio Shack store.

Includes owner's manual and telescopic antenna.

Price: $125.

|> " 5. Locate the (64 pin quad flatpack) microprocessor
|> IC labelled "UNIDEN UC-1147" and the 10k ohm
|> (brown-black-orange) leadless resistor positioned
|> above the letters "DEN" on the IC. "
|>
|> Rather than a brown-black-orange resistor, there was a small
|> rectangular-shaped object with "103" printed on it. (There was also
|> another one over the letters "UNI", but with nothing printed on it.)
|> I saw other resistors which fit the description, but they were not
|> at all close to the IC.
|> Now of course, I wasn't going to perform this modification...
|>

The chip compoent with "103" on it IS a 10K resistor. The first two
digits are actual numbers and the last digit is the number of trailing
zeros (in ohms). So 10 followed by 3 zeros is 10,000 ohms. The compoent
over the letters "UNI" is probibily a capacitor (chip capacitors usually
have no markings.

Hope this helps.

2532. Military - Air Monitoring in Maryland

Newsgroup: rec.radio.scanner
Date: 1994-09-19 14:02:10 UTC
From: domonkos@access.digex.net
Message-ID: <r3PVkiubGkEQ066yn@access.digex.net>
Source record: 268489

I assumed most of the Military Air Band excitement would be in the 225-400 Mhz range; wrong! I live near Aberdeen Proving Grounds in Maryland and my hilltop location and Radio Shack multiband vertical netted me hours of A10 live fire training cockpit audio on Low Band VHF. I acquired a recent copy of the North East Directory of Military Communications and punched in about 100 frequencies into an 890XLT. Aside from some boring comm's from some mil-aircraft the A10 frequencies were the best yet.

Here are the active A10 squadron training tactical frequencies.
CCTSS freq's are not used but the official tone is 150 Hz.

32.45 Mhz
34.40
36.80
40.15
41.45
41.95
49.75

All the above were in FM mode (standard on scanners).

I used the remote tape feature of the 890 and squeezed a days worth of activities into about 45 minutes of listening.

Last night's tape of the day netted more live-fire training. What amazed me was the casual tone in all comm's, very un-like what you see in movies.

Anyone within radio range of military bases known to be used for training purposes should get a copy of the above frequency directory. Remember, radio range when listening to aircraft can be well over 100 miles when they're at altitude! Good hunting!

From: horak@convex.com
Message-ID: <35k61f$lb0@eugene.convex.com>
Source record: 268487

Yet another easy way to improve your 30-50 scanning experience is to make a 10 foot dipole (468/frequency in MHz = length in feet, so 468/46.8MHz which is in the cordless phone base band, equals 10 feet) out of Radio Shack speaker wire (24 feet of #42-2478 on page 23 of the 1994 catalog). Also, get a RCA to BNC adapter. Take one end of the wire and cut off the BNC, leaving a few inches of wire on it (you'll use it later). Take the 23 feet or so of wire and seperate the cut ends about five feet apart so that it stretches ten feet end to end. Mount this dipole on the wall, ceiling, or somewhere up off the ground. You may find slightly more signal strength if you mount it vertically. The rest of the length is so you have plenty of wire to run from the antenna to your scanner. Of course, if you need a longer wire run, use the 50 foot wire. Since 30-50 is a pretty low frequency, cable losses are minimum. You'll be amazed at the improvement in low band performance from this inexpensive antenna. Now, for that other BNC end piece you cut off, seperate the wires until you have about three inches of wire on each side. Use an ohm meter to determine which wire is the center lead. Completely cut off the ground wire and leave two or three inches of the center conductor wire. Get another RCA to BNC adapter and you have an average antenna for cellular and more importantly, a good antenna for very strong signal situations where a regular antenna gives you overload. Since this short antenna is almost worse than a rubber duck, it is ideal for use at concerts, finding wireless mikes, etc. without picking up other interference.

Well, A friend made a suggestion to me which I discounted directly but I want to hear someone else's answer on it too.

The suggestion was to use the same antenna on both of my scanners (when they're side by side) by simply using a "T" and a short run of coax.

I say it'll produce a mismatch since the non-antenna end of the cable should look like a 50ohm +/- load to the antenna and vice-versa. (Two 50ohm loads in parallel=25ohms).

Anyone ever try it? Anyone got any thoughts on the idea?

It's common to split an antenna. So long as you're only
receiving, you don't need to match the line. It's
when transmitting the issue becomes important.

Hi Bob,

The frequencies are in the DisneylandFAQ at rtfm.mit.edu or
archived in the news.answers spool. Also, Richard Hyde,
KC6QBO (ex Apple employee 64 I think) goes to Disneyland
frequently with his HT so he may know more than the FAQ.

(Rick Hyde rah@netcom.com)

Unlike Great America, Disneyland apparently encourages people to
use their repeater.

Uhm... although all involved in this thread are Hams, let it be said
anyway that the repeater use being encouraged, is the HAM repeater
(for use by Hams) and not the commercial band systems they may have.

I don't know the freqs but I have some info on this. In an issue of
USA Today last week, the inventor of the coach->QB system was interviewed
concerning a report (that turned out to be false) that said an NFL
quarterback heard a hotdog order (or something like that). In the
article the guy said that the signals have a squelch code AND are
encrypted (my guess is frequency inversion). The encryption (inversion?)
would keep opposing teams from hearing the signals with a run-of-the-mill
scanner and the squelch code would prevent unintended triggering of
the QBs receiver. FYI.

By the way, does anyone know the ref -> network "penalty-explanation"
freq?

I tend to agree. Don't worry a whole lot about mismatch caused by
connecting two scanners to one antenna. I'd gamble that the rubber
duckie antennas aren't too well matched to their receivers, either.

HOWEVER, be aware that significant RF comes *out* of each of the
scanner's antenna jacks--primarily from their local oscillators. This
can cause some pretty unexpected, moving "birdies" and perhaps even
some strange intermodulation.

The older Motorola's use 4800BPS in a proprietary modulation scheme.
(not too hard to defeat if you really want to..).

I build software to interface them to Unix systems. They store a
form, which is a screen to fill in with info. The officer then fills
in the screen of their choice and sends it to the central unit.
They also can receive info, and screens, from the central unit and
other cars (usually relayed...).

For what it's worth, Motorola's cost estimates are usually pretty low
when they tie this in with their "improved" 800 MHZ trunked systems. It
seems [UNSUPPORTED OPINION FOLLOWS - THIS IS MY PERCEPTION]
they market, and county councils buy, these systems to keep them more secure
from prying ears. In our area, they were talking about this, yet my
monitoring of the county channels showed them to be pretty quiet...

If you hear of an 800MHZ system scheduled for installation by your
local government, and its trunked, you should attend the council
meetings. I can give you a few places they've had to install extra
towers, etc. to get proper coverage.

Rick

> I believe that police dmv terminals work on 300 baud so you should

In all liklihood, you believe wrong.

All Public Safety MDT (Mobile Data Terminals) that I've seen use
proprietary-to-the-manufacturer non-standard data formats, and run
at 4800 baud, 9600 baud, or some non-standard rate. They are NOT
ascii.

The usual public safety MDT ALSO has encryption capability on top of
the proprietary coding, and it's often used, even though I've yet
to see ANY report of confirmed success in decoding the basic formats
by a monitor, other than by buying the appropriate MDT reciever from
the manufacturer.

> lancecr@netcom.com

Lance

The expanded memory mod requires you to manually switch between "virtual radios", each with 400 channels in 10 banks. Each "virtual radio" is seperate from the others, and you will not be able to scan accross more than the regular 400 channels at any one time. The CE232 is probably better for some people in that it allows you to actually program the freqs, mod, BW and all, directly into the 2006s batery backed RAM, and then when you un-plug the computer interface, they are still stored, and you can use them away from the computer. The OPTO456 board requires the computer to be connected, and software running, to use any of its features, but it does have DTMF and CTCSS decoding that the CE-232 doesn't have. The only incompatibility problem with mods, is if you put a faster clock rate on your 2006 CPU, the CE-232 won't work reliably above ~14MHz. The OPTO456 won't care what speed the CPU uses, because it disables the 2006 CPU board when its running.

The OPTO456 board disables the internal CPU of the 2006. It doesn't care how many channels you have, because the 456 takes over control of the receiver RF section directly, and uses your computer for storing the channel info. When the software stops, the 2006 goes back to using the normal CPU as though the 456 wasn't there.

The CE-232 interface (formerly the HB-232) from Commtronics will allow you to program the channels and banks by computer control by electronically pushing the 2006 front panel buttons as though you were entering them via the 2006 keyboard. But the computer is doing the button pushing. By

switching to a different "virtual radio" you can program all 16 or 32 or more "virtual radios with every freq combination you might ever encounter and you won't have to enter them through the 2006 keyboard. If you do that a lot, its a godsend. The 2006 CPU does all of the work during scanning as the CE-232 can only push front panel buttons for you. A friend has an HB-232 in his 2006 and the installation was much more dificult than the OPTO board, but I don't know if the newer CE-232 is any easier to install than the old HB-232 was or not.
Has anybody out there installed the CE-232 interface? Lets hear about it.

Good scannin' to ya.

2561. Wear on Antenna Connector?

Newsgroup: rec.radio.scanner
Date: 1994-09-20 03:05:32 UTC
From: rout0003@maroon.tc.umn.edu
Message-ID: <rout0003.780030332@maroon.tc.umn.edu>
Source record: 268518

I've got a BC200XLT which is about 6mo old and was wondering how much I should be concerned about wear on the BNC antenna connector? I store my scanner in a "hard" case (small plastic toolbox) and carry it EVERYWHERE I go. My biggest concern is that I remove the antenna when I put the scanner in the case while transporting it in the car [Minnesota has a scanner law :-(], and I also use a GRE Superconverter II which causes me to continually use/abuse the antenna connector on the scanner. I was wondering if I should be overly concerned about the excessive wear on the connector, and if there is anything I could do to help the problem? Any suggestions/help would be appreciated.

Thanks!
-Andy R.

If the data burst is like that on our Motorola radio system (and most
other systems) it identifies the radio which just transmitted.

I have heard the data both before and after transmissions. The advantage of
before is that the radio operator can ID the transmission while listening,
not having to wait until the end. Unfortunately, this requires the
transmitter to wait a second between keying up and talking. I have also
heard it in the middle of transmissions, but this tends to make it
difficult to understand the speech.

When speaking car-to-car the data is not sent because
a) many portable (hand-held) and mobile (veh. mounted) radios
have no displays
b) this is generally between two users who already know who the
other user is
c) tactical communication is often done using car-to-car frequencies
and speed is critical

Similar data burst can be sent by many radios to indicate an emergency
situation, but in many areas it is very common to get false alarms.
At least in my town, the alarm is basically ignored.

I know of one instance where a police officer pushed the button and
ten minutes later the desk asked if there was a problem (in the meantime
the officer had arrested the subject who was trying to hit him over the
head with a shopping cart.) A friend of mine pushed the button once
because he was being attacked by a patient and desk simply came back with
instructions for him to reset his radio--they never asked if there was a
problem. (EMS dispatched by PD and uses their radio system.)

I know of one occasion where the button was actually helpful. A PO pushed
the button after being punched in the jaw. The dispatcher on duty didn't
ask any questions and immediately flooded the area with all available POs.
It was a good two minutes later that the initial PO got a chance to speak
into the mic and tell the desk what was happening.

I called MaryMac last month and kindly asked whether their pro43s were modifiable (this was before I knew of the "A" in the serial #). This jerk on the other end said "I do not want to have anything to do with modifying scanners". I said that I do not want you to modify one, I just want to know if your 43s CAN be modified. He said in an angry tone that he didn't want to talk about it anymore. I think he was afraid that he might be contributing to illegal activity by merely talking about it. I then called Grove and asked about their 43s. A nice lady quickly told me that they had sold out all modifiable 43s and that all remaining stock could NOT be modified. Thank you Grove for not pushing one of those new ones on me. I ended up buying a modifiable demo locally and paying the tax.

Michael Schuster (schuster@panix.com) wrote:
: >I was just wondering if they are any good or not, and if anyone
: >knows if they are modifiable to open up the cellular.

: They're "ok" if you get a good one. Each model has its quirks and
: strengths.

: No Trident scanner now sold in the US will receive cellular frequencies or be
: reprogrammed/modified to do so. You can be certain that after having big
: fined levied on them by the FCC that ACE made =sure= of that.

Well, they use to have their reception ranges programmable, do you
know anyone who tried those instructions on a US model and found they
did not work?

It's interesting to note the AR-8000 has its cellular locked out in
memory by serial programming, and there are folks already working on
the software for use in the US to convert them to cellular. Since
some or all of the code is in FLASH Rom or NVRAM and it *is* fully
accessible, even if they were to f*ck with the code in the US models,
it will soon be possible to put it back the way it's designers had
intended it!

Personally, my solution is overseas. Funny how the FCC feels it
needed to help the world's economy at the expense of the US dealers,
and with possession legal, they can not stop you bringing them in,
just keep it 3 or less and of course, they are not for use here,
merely exhibit/show/possession, the reasons you are exempt for any
such import ban. I mean if I really wanted to get down right NASTY
about it, I could import them for purpose of re-sale to government
agencies :-) which also is a way in, but then re-define the purpose
after delivery -- since records and licenses are not required to
deal with such items in small quantities. Meaning, I take it in with
intent of re-sale to government agency, and then 6 month's later, I
neither know where it went nor have a receipt. Since I would have
paid customs duties, there would be no reason (and NO legal reason)
to maintain records since I would then show I was not acting in a
commercial business transaction, but a personal one and -- err, yes
sir it was re-sold, can't quite recall to who though, may have been
out of the country though! The law does not require such records.

Think about that and the next hamfest tailgate area -- how many of
those hams keep records on what they sell? Not many and are they
required to do so by law? No. Are they required to keep identity
information on who buys a receiver -- even if they submit tax? No,
as long as the amounts are correct.

Well so much for the latest installment of how to bypass the FCCs
dumb rules and LONG LIVE INTERNATION TRADE!

Source record: 268388

Last Christmas I received a Grove ScannerBeam as a gift. I am now getting around to putting it
up (I have a lot of half-built kits too). My thought has been that my main use for this antenna
would be to receive military satellites in the 200-400 MHz band. To do this is going to require
the outlay of some additional cash so I have a few questions:

1) Is there enough traffic being transmitted in the clear via these birds to make the investment
worthwhile? What type of comms (i.e., would I be able to listen to the operations going on in
Haiti if I had this in place now or would I just pickup routine stuff?) can one expect to hear?

2) Is the typical mode FM, SSB, or what?

3) Is it reasonable to assume that a log periodic, 10dB preamp, and a PRO-2004 (feeding an
ICOM 745 if SSB is needed) will do a decent job?

4) WHO MAKES AN INEXPENSIVE, REMOTELY POWERED PREAMP THAT WOULD WORK
FOR THIS APPLICATION?

5) WHERE CAN I FIND AN INEXPENSIVE, LIGHT DUTY AZ-EL ROTOR FOR THIS
APPLICATION?

You didn't say what make/model scanner you were using but you
may have been hearing an image. Cellular images above 900 MHz
are *very* common in Uniden scanners. Or the user you hear could
have been using an SMR repeater with telephone interconnect and
was confused.

I work in the AMPS Wireless Development (cellular phone) Laboratory
at AT&T Bell Labs and don't know of any US cellular phone systems
in the 900+ MHz range.

Look at it from a competent salesperson's point of view. A customer comes in with a problem that (s)he says is related to a fuse. Did (s)he bring the fuse? No? Sell them a fuse. The terminology might be wrong and one might provide a gentle correction, but it might be easier to agree, knowing that the problem was being addressed, than possibly offend the customer. A salesperson might show the customer an intact and a blown fuse and ask which the customer's resembled, but if the customer knew enough to *assert* that the problem was the fuse, why cause a fuss?

//I recently turned on my 200XLT after a while on inactivity and was confronted
//with a brief flash of the display, where I noted the low battery icon was on.
//Then the scanner went dead. No problem I said to myself, just plug it in to
//recharge. Well, since that time, the scanner has not returned to normal, even
//with the battery pack fully charged.
//ago. The low battery mod has not been done. Any help would be appreciated.
```

The same thing happened to mine after about 6 months of inactivity. It still scans but the receiver is dead. I took it apart and found that a small transistor or regulator was fried and the top was blown off. I don't know what it was because I don't have a schematic or parts layout. I suspect that the nicad pack reversed voltage bacause of the inactivity. I put it on the charger when it didn't work and should have checked the voltage. Also the low voltage mod had been installed in this scanner.

How many others have had this BC 200XLT problem?

Jim

Uh, maybe just as well that you didn't, Mike. That business about "earphones aren't electrical" is definitely ROFL material, but you should know that the reason that the portable electronics industry has switched to those coax power jacks and plugs is that the typical phone jack, whether mini or full-sized, tends to short the plug tip to the ring and /or sleeve for a moment as the plug is inserted. This is not good for most power supplies (or power wires either).

2580. Re: What about RS Realistic 34?

Newsgroup: rec.radio.scanner
Date: 1994-09-20 17:03:32 UTC
From: jackson@longlast.cs.nyu.edu
Message-ID: <35n4l4$19h@thecourier.cims.nyu.edu>
Source record: 268413

I have (two) '34s and a 2005. If you ever scan 800MHz for
police, you'll get cellular images throughout rendering
it useless. I got the 2005 because I was living here in
New York and the intermod shredded the 34.

The 34 is only double conversion (meaning the images aren't
moved but 20MHz away) and the image rejection circuitry isn't
all that good. The unit worked fine in 453MHz while living
in Philadelphia, but 476MHz here in NYC was crushed. I had
many good years with it in the 'burbs though. The power *and*
charge plugs ended up falling out of the machine. I bought
another one with a perfect body and smashed screen, played
Frankenstein, and gave a good working unit to my girlfriend.

I loaded up the internal connection of the BNC adapter to
the circuit board with solder, and that reduced the clickiness
the unit had whenever you would shake it. Also, it picks up
signals better than my dash mounted 2025 and my 2005 (using the
stock whip).

An easier way to listen in on the action both in the airport and on the plane is to use an Optronics AM Interceptor. No searching, scanning or frequency programming is necessary. You simply turn it on and it locks on to the strongest AM broadcast nearby. With practice, you can reject strong AM broadcasts from commercial stations and receive only airport/airplane broadcasts. A similar device is Optronics FM Interceptor for the FM mode. I've been pleased with the quality of the product and the reception.

2583. The Pro-2028

Newsgroup: rec.radio.scanner
Date: 1994-09-20 17:54:55 UTC
From: plocke@irvine.com
Message-ID: <CwFwFK.GCy@irvine.com>
Source record: 268394

The local Radio Shack was dumping their Pro-2028 scanners for 99 bucks
last spring, so I picked one up for my desk at work. I have seen no
mods or special unpublished functionality discussed for this simple
50-memory scanner in this group or in the 'mods' ftp directories.
Does anybody know anything interesting about this scanner?

Please email responses to cpl@irvine.com

Thanks,
cpl

2584. Summary: AOR-Questions

Newsgroup: rec.radio.scanner
Date: 1994-09-20 17:57:24 UTC
From: guest1@ind.rwth-aachen.de
Message-ID: <35n7q4$82h@urmel.informatik.rwth-aachen.de>
Source record: 268390

Weeks ago I posted the following questions:
****
1. I am looking for a remote control program (over RS-232) for my AR-3000.
The program should be running on an IBM PC.

It should be able to scan frequency bands, log field strength statistics and
give a graphical overview about the long term band activity.

I saw several programs for Icom and Kenwood rigs on ftp.funet.fi in
/pub/ham/misc, but I didn't found any programs for the AOR AR-3000.
I searched with archie and veronica, but I found really nothing.

There aren't any sources for the Icom and Kenwood programs on the net only
the binaries. Has anybody a program for the AR-3000 or the sources for
the Icom and Kenwood programs? If I get this sources I will modify them
for the AR-3000 and post them on the net.

2. Are the newsgroups rec.radio.scanner, alt.scanner or rec.radio.digital.misc
achieved by any anonymous ftp side?

3. There are a lot of programs to decode packet radio (AX25).
They need different hardware support (TNC, FSK-Modem or a single OP-circuit
at the serial port of the PC).

The program pktmon12.pas for example can decode AX25. It only needs
a OP which convert the scanner audio input in a binary RS-232 signal.
It comes with full source code and works very fine on strong signals.

Has anybody modified pktmon12.pas or any similar programs to decode

a) the number dialed by any kind of mobile phones
b) the number dialed by any kind of cellular phones
c) the number dialed by any kind of cordless phones
d) POSAG paging signals
e) airplane VHF-transponder signals
f) any other digital stuff?
****

I got no answers to questions number two and three.

I got one answer to the first question. Thanks to Ed Greenwood (edg@northcoast
.com).

There are two programs on the CompuServe hamnet forum for the AR-3000 remote
control.

Spectr.zip (10kB) is a qbasic program running under DOS to make spectrum plots.
It is very slow and produces a low resolution graphic. I cannot recommend it,

but it works.

AR3KA.ZIP (417kB) is a scanner control program running under Windows
and looks very nice, but I cannot transfer any valid data to my AR-3000!
Maybe I'm doing something wrong. I'm still trying.

With best regards
Karl

Depends what you mean by "normal". When the battery gets really low in
a 200XLT it will set the lock out on each and every entered frequency.
It seems to keep the entered info, it just makes you go through and manually
unlock each one as sort of a penance for not charging often enough.

When at Disneyland you may also want to monitor their amateur repeater
on 146.940. If you have a 2m rig you might wish to use the repeater.
Check the ARRL repeater directory for the PL frequency. Also, there
is a network held at 7:00 pm on Thursdays.

>law. I say shouldn't, since it won't be out until next month.
>But who knows... Once it's out, there may be someone out there
>who buys one, takes it apart, and figures something out...

Although if the manufacturer is smart and REALLY WANTS
to comply with the law, all they have to do is use multi-layer
PC boards and make greater use of custom LSI chips. Trying to
do ANYTHING with such a radio, including repair one, would be damn
near impossible - trust me, we see this happening frequently in the
computer business. If you get a PC board that is 7 or 8 layers thick
and has a defect WAAAAAY down in the middle, it may well be
impossible to repair....which would have a similar effect on
modifications.

The custom IC's, if done in Large Scale Integration (LSI)
means one big chip to do about 100 things, with fewer components on
the PC board. Signals that you used to be able to access on the
PC board would then be *inside* the IC where you can't get
at them.

While this has the tendancy to make the units more reliable
in the sense that they have fewer parts to fail, AND, less time
consuming to troubleshoot (if any of X, Y or Z happens, replace chip
A) they are a real SOB to try and modify.....

Hugh Hemington (hughem@netcom.com) wrote:
: Does anyone know what the actual DTMF frequencies are? I also downloaded
: and wasted time with DTMF101.EXE, on my SB16ASP. Could we get the source
: code to this thing? Maybe a Windows version would be more usefull anyway.
: hughem@netcom.com

Look in the ARRL handbook, they are listed there. They are also
listed in one of those Engineer Mini Handbooks that the Rat Shack sells
for less than 5 bucks. If you buy a DTMF encoder or decoder from Rat
Shack the literature enclosed also has the actual dual tone frequency
listings. You may even try an electronics handbook.
If you want to build a DTMF decoder, it is really simple, and the
entire circuit is listed (If my memory serves me correctly) in the ARRL
handbook. There is a simple circuit included in the little paper that
comes with the DTMF decoder chip that can be picked up at the rat shack.
The out put is in binary, but can be converted easily enough.
And as a last resort, I have seen shareware programs that will
use a Soundblaster or compatable card to decode and store all dtmf tones
sent to the input of the mic jack. Check your local packet BBS with a
landline entrance.

: 3) Is it reasonable to assume that a log periodic, 10dB preamp, and a PRO-2004 (feeding an
: ICOM 745 if SSB is needed) will do a decent job?

: 4) WHO MAKES AN INEXPENSIVE, REMOTELY POWERED PREAMP THAT WOULD WORK
: FOR THIS APPLICATION?

: 5) WHERE CAN I FIND AN INEXPENSIVE, LIGHT DUTY AZ-EL ROTOR FOR THIS
: APPLICATION?

: 73, Harold
: ---
: Harold
: hpeach@ca.uky.edu

A log periodic doesn't give enough gain so a 10-20db preamp at the antenna
will help. You'll also need to adjust the elevation of the antenna.
MT had a good article a month or so ago re; building a helical gain antenna
for mil-sat use.

rec.radio.swap is for all radio gear, although it's mostly ham stuff
and scanners. If you don't get it, ask for it by name.

|> What About a newsgroup named :
|> rec.radio.scanner.marketplace ?

|> And what about a file named :
|> used-scanner-price ?

That could be summarized as:

1> 50% of current price if it's double conversion

2> 75% of current price if it's triple conversion, and less
than a year old. Otherwise, see 1.

3> 85% of current price if it's triple conversion, cellular modifyable,
and still available.

4> 100% of last offered price if was <3> but is no longer
available.

Notice there isn't any reference to what you paid for it.

I'm an Engineer with a defense contractor, and I debug a lot of PC boards. Multilayer boards are easy to fix. When you discover that your circuit is fucked up, get out the scope and look for a missing signal. Will typically be a ttl input sitting at 2 volts (I'm a digital guy). Bingo - busted trace. Solder a 30 guage wire from the driving chip to the chip sitting at 2 volts. (Put wire on solder side.) Tack down the wire and you are done. Doesn't matter of 2 layer or 20 layer board - just bypass the defect - no?

2598. Carter's Haiti negotiations intercepted via scanner

Newsgroup: rec.radio.scanner
Date: 1994-09-20 19:29:03 UTC
From: tbohr1@ed8751.pto.ford.com
Message-ID: <35nd5v$j3c@ef2007.efhd.ford.com>
Source record: 268401

Did anyone notice on CNN monday morning Bernard Shaw had a transcript of
on of Carter's conversations during the Haiti negotiations, and was
reading them to Carter. Carter seemed surprised at this, saying something
like

"I thought that information was classified and not to be leaked...,
and I am curious could you tell me how you got it?"

To which Bernie responded: "We recieved this information from a source
in haiti who was able to pick up the conversation
on an upper side-band ham radio".

Carter then mentioned something about the phone link supposedly being
secure, then I think he again pressed Bernie for the name and Bernie
refused to give the name of the source, only how they got it. Carter
then said something about "Isn't this similar to what happened to Prince
Charles"...

My thoughts: Either the conversation was picked up on a scanner in the
cellular range (I bet it was Glen Roberts!) or there must
have been an extra link or two (Carter to translator via
cell phone, translator to Haiti generals via ham radio, etc.

I forget if you conversation they were discussing involved
Carter to Clinton or Carter to Haiti. Carter to Clinton
would likely involve scenario 1, while Carter to Haiti would
likely involve scenario 2.

Did anyone else see this and can expand or correct my memory? I really didn't
pay much attention to the program until the "upper side band ham radio"
reference was used.

Tim

Well, I thought about things like that... but at the time, it was only a few
hours before a major public-service event... so after I found that Rat Shack
didn't even stock the "real" connectors, save for the ONE they had that I had
to use to plug into the radio, I was forced to substitute. I wasn't aware of
the shorting thing though... but since the only time it gets unplugged is when
it falls off my belt, well, no big harm done to the battery pack! Thanks for
the advice though, it is something to keep in mind for future projects...

I strongly doubt it had anything to do with Ham Radio. Hams aren't involved in that sort of communication. Check out rec.radio.shortwave - it appears that several shortwave listeners heard the same conversation on some sort of HF (shortwave) phone channel.

Greg.

> Multilayer boards are easy to fix. When you discover that your circuit is

I guess all that leaves is the manufacturer just totally incasing the
circuit boards in resin. You just couldn't get to any part then, without
wrecking it. Of course, this would leave the radio you bought probably
unrepairable, even if the smallest thing goes wrong with it. I just
don't know if manufacturers would want to create a product that only
could be taken apart with a blow-torch...

2610. PRO-51 Mod: Shorten squelch tail

Newsgroup: rec.radio.scanner
Date: 1994-09-21 01:34:06 UTC
From: moy@xp.psych.nyu.edu
Message-ID: <9409210139.AA07611@xp.psych.nyu.edu>
Source record: 268422

Hello fellow scanbots,

Radio Shack PRO-51: Modification to shorton squelch tail

This change was performed successfully on a unit coded "11A3." The
CPU in this unit was marked "Uniden UC1581." Use the following
information at your own risk! Neither I nor my employer are
responsible for any damages you may incur from this information!

Orientations are with the set flat on a work surface, LCD display
facing down, with antenna BNC and knobs facing away from yourself.

As with any electronic instrumentation, remove all power and take
all necessary precautions to prevent damage from electrostatic
discharge (ESD). This modification requires fine soldering and
familiarity with surface mount devices.

CAUTION:

Be aware that parts of the circuitry will *still* be powered!
There is a capacitor on the digital board that keeps the channel
memory alive. This capacitor may contain enough energy to damage
the electronics should a short occur.

Parts required: One 1/10th watt carbon resistor, 100K to 220K. Value is
not critical. A lower value shortens the time the squelch remains open
after incoming signal stops. The resistor should physically as small
as possible.

Opening Case

Fortunately, this set is very easy to open. Open battery
compartment and remove batteries. Remove four screws: two
straddle the sticker on the back of the cabinet, two others at the
upper part of the battery compartment. There are two small
plastic detents at the floor of the battery compartment. They are
directly downwards from the "-" and "+" legends, which are molded
on an extension of the removable back. These detents will need to
be unhitched to allow the back to separate from the front.
Pull back off gently.

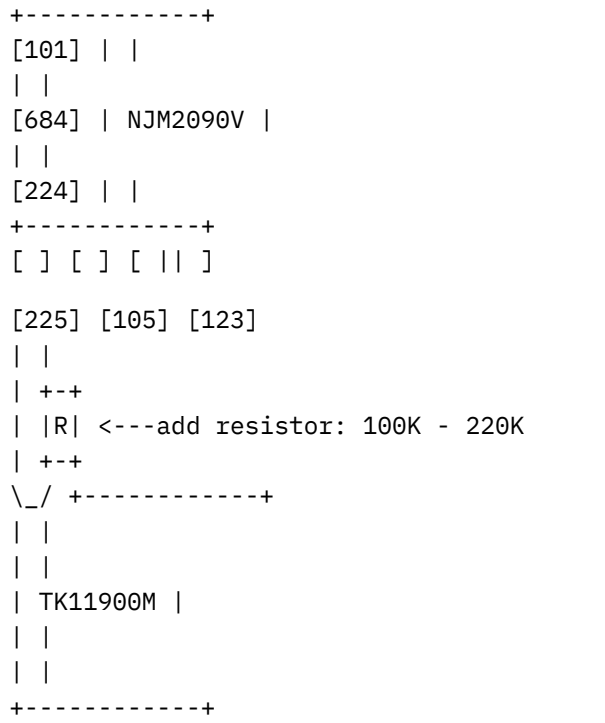
Remove RF board

The RF board is attached to the top panel, which contains the
volume and squelch controls and the antenna connector. At this
point, the board is essentially free and will separate from the
rest of the set when the header connector at the lower right is
pulled apart. This header provides electrical connections between

the two boards. Lift the RF board straight out, and set the rest of the radio aside. Flip RF board over, keeping BNC pointing away from yourself.

Add resistor

Refer to the ASCII diagram below. Bend one of the resistor leads close to the body of the resistor so that the resistor forms a hairpin shape. Trim leads and solder the new resistor in parallel with the chip resistor marked "105." The latter is positioned between the two surface-mount IC's towards the bottom of the RF board. Press the new resistor parallel to the circuit board, making sure there are no shorts.



Thanks to Bob Parnass for clarifying the nature of the "squelch tail" problem and for inspiring me to figure out this modification.

Moy Wong (moy@xp.psych.nyu.edu) Dept. of Psychology, New York University

Panasonic also makes a cordless phone for about $120 that uses
this primative "frequency inversion" scrambling technique that
makes you sound like Donald Duck to someone unable to descramble
the audio signal. (You can buy little hobby kits to descramble
these things... costs about $20 to $30)

Motorola supposedly has a cool looking cordless "flip phone" which
looks like their cellular units. These also use some form of
scrambling. I saw a picture of this thing in one of the "hobby"
electronics mags.

Does anyone know where to buy this Motorola cordless? I haven't
seen them in the stores yet.

Okay, looking into my crystal ball here, this is what I predict...

All kinds of telephone executives will read/hear about how Carter's conversation was heard. They will then start another round of bribes to Congress to get a law passed that bans the sale or manufacture of any shortwave radio that can also receive any frequencies outside the shortwave or commercial broadcast bands. It will also be made illegal to listen to anything other than recognized shortwave braodcasts. Kind of sounds like the cellular phone/scanner episode doesn't it...

IMHO decayed is equivilent, but from listening to local cops here
(Hudson Cty., New Jersey across the river from NYC) I'd be more generous
in describing the persons in question--they are simply drunks.

Kinda weird abbreviation for drunk but then again Hudson Cty. PDs use
"14" instead of "10-4" -- oh well.

I went to my local Rat Shack to buy a Motorola to BNC adapter and opend a conversation with the geek at the counter.

I asked him directly about the PRO-2006. His comment to me was that another local RS had sold one after RS had pulled them from the shelves. The employee that sold it was forced to get it back from the guy who bought it. After retrieving the scanner he was terminated.

My wife them asked him how much his store was selling the PRO-51 for. (We just got ours about three weeks ago - and like most women, she wanted to know if it was cheaper at this store.) At this point he got a little nervous. I brought up the cell mod ... acting like I didnt know it ... he got real quite and proceded to note the basic instructions for the mod on the back of my receipt! He stopped quickly at the site of his manager coming in the front door from dinner.

This whole thing is a non-issue. Whenever I go to RS and we get to the point where they ask for a tel no I simply say "NONE". If they don't get the hint and ask for a name I say "CASH". It have *never* gone any further than that. I fail to see what the problem here is other RS bashing or wasting bandwidth.

Uh, the 2006 can't have any kids (Pro-51's) since you've done a complete
vasectomy?

Actually, you get a negligible increase in scanning speed. (13% - 15%,
from what I've read posted in this group, so 25 cps turns into about
30 cps) (cps = channels per second)

The Pro-34 is an excellent scanner except for one thing, it is awfully
slow at scanning and searching when compared with todays models. The
Pro-39 and Pro-43 with hyperscan can scan at least 3 times as fast as
the Pro-34.

Source record: 268351

-=> Quoting Gary Spong to All <=-

GS> Looking for these for a friend. I'd be very grateful for the
GS> modifications for the Realistic Pro 2032. -Thanks

Hi, Gary...

Product...Realistic PRO-2032 by Radio Shack
for units with date codes 4A4 and under
Purpose...Modify for continuous 800 Mhz coverage
in appropriate 30 Khz steps where applicable

Updated 7/94

** This modification is only valid for units manufactured before 5/94.
** Disclaimer...All modifications are done AT YOUR OWN RISK.
** Performing this modification may void your warranty.
** Perfroming this modification may enable certain portions of the 800 Mhz
band that is illegal to monitor under federal U.S. law.
** I strongly suggest taking ESD precautions by getting a static strap as
this involves work with static sensitive devices. Any electronics store
should have one for purchase.

This information is from the June, 1994 issue of Monitoring Times, p.
112.

Required equipment...small-tip soldering iron, small gauge rosin core
solder, desoldering wick, Phillips screwdriver, 1N914 or 1N4148 diode.
1. With the scanner unplugged from power, remove both upper and lower
covers (foru screws in the rear of the cabinet), taking care not to damage
the speaker wires.
2. Set the scanner upside down with the back facing you. Locate the
microprocessor shield (upper left corner near volume and squelch controls).
Unsolder and remove the shield.
3. Refer to the diagram and locate the three-legged diode at the lower
right of the microprocessor chip. Carefully unsosolder and remove this
diode.
4. Referring to the diagram, place a 1N914 or 1N4148 switching diode
across the solder pads as shown. (NOTE POLARITY) Remove any excess leads
and carefully solder it in place. Be sure it's leads will not contact any
other components, paths or the reassembled shield. A small piece of tape
may be used as insulation if necessary.
5. Plug the scanner into power, turn it on and test the unit by entering
any frequency that may have been blocked in the 800 Mhz range.
6. If successful, unplug the unit and reassemble the scanner.

AC> Hi all! I'm new to the net and to scanning. My son has a Uniden 10
AC> channel scanner he got as a gift a couple of years ago. I found it in
AC> the bottom of his closet about a month ago and started playing with it.
AC> I started reading this newsgroup around the same time. The bug bit me
AC> and I got my PRO2006 last Saturday. All I can say is WOW!! If you are
AC> debating about getting a 2006 then I say just get it. You won't be
AC> disappointed.`

Welcome to scanning! <g> I have been scanning since I was 10 or so.
(I'm 30 now.) Ever since my dad brought home an 8 channel crystal RS
scanner, I have been hooked. I think I used it more than he did. <g>

AC> Now a couple of questions.
AC> What's a good range to search for military air. There is an AF, Air
AC> NG, and and Army base within 30 miles of my house near Columbia, SC. I
AC> got the RS discone antenna when I got my 2006, so I should be able to
AC> pick these up. Everything else is loud and clear!

An area to look around is 230 to 400 Mhz range. There are more areas,
but this is the most general area. I am not a big listener in this area,
so I am sure people will supply you with more specific freqs. They also
pop up here from time to time.

AC> If I do the scan speed mod, will I still have a high and low scan
AC> speed? Will the speed button still work?

Yes, you will still be able to change the speed. No problem.

Jerry

2636. What would a diff. antenna buy me?

MS> I have a Pro51 with the antenna it came with. What exactly would I
MS> gain if I would switch to a different antenna? The local RS droid said
MS> none. He also didn't know why the 51's were pulled from his store
MS> either (and was surprised to find out).

Better tell that RS droid to call his corporate office and fast. He could be in a lot of trouble for selling these units...oopps...on second thought, let him get in trouble. <g>

The gain on performance depends on what the duckie is designed to do. Some are set specifically for certain frequency ranges. You may get added performance in one range and decreased in another. RS does sell a telescopic antenna. This is a neat antenna because you can easily change the length for the range you want. This will enhance the performance, especially in the low band range, if that's where you like to listen.

Obviously, the duckie supplied is a compromise across all ranges of the scanner.

Subject: Alpha Bravo Charlie Delta: phonetic alphabets (repost)
Date: 7 Sep 1994 19:59:56 GMT
Organization: University of Cambridge Computer Laboratory

Phonetic Alphabets (Alpha Bravo etc)

There is a widely known alphabet Alpha Bravo ... Yankee Zulu.
Such alphabets are variously known as phonetic alphabets,
radio alphabets and spelling alphabets. This collection
currently includes alphabets for the following languages:

English, French, German, Dutch, Flemish, Italian,
Rumantsch, Slovak, Polish, Hungarian, Swedish,
Finnish, Russian and Chinese.

This posting is a repeat of the one of 23rd July.

My thanks to the many contributors, not all of whom are
acknowledged below.

I can make no guarantee of accuracy of this information;
indeed please send me any corrections or additions.

In my capacity as the editor of this collection I have no
objection to the further electronic distribution of this
posting in full in circumstances where it is likely to be of
interest.

Comments in square brackets are my own.

Brian Kelk bck1@cl.cam.ac.uk

***** ENGLISH *****

The NATO phonetic alphabet (as per the Cambridge Encyclopedia
of Language under Seaspeak):

Alpha Bravo Charlie Delta Echo Foxtrot Golf Hotel India
Juliet Kilo Lima Mike November Oscar Papa Quebec Romeo
Sierra Tango Uniform Victor Whiskey Xray Yankee Zulu

[The same alphabet, modulo Alfa and Juliett, is approved by
the International Civil Aviation Organization and the FAA.
The International Telecommunication Union Phonetics list
has: Alfa, Juliette, Oscar/Oskar, Victor/Viktor.
Dates from about 1956.
UK police use Indigo instead of India (?)]

Telecom B:

Alfred Benjamin Charles David Edward Frederick George Harry
Isaac Jack King London Mary Nellie Oliver Peter Queen Robert
Samuel Tommy Uncle Victor William Xray Yellow Zebra

[Found in Swedish, Dutch, Hungarian telephone directories.
A Swiss directory has: Andrew Charlie Lussy Queenie Sugar]

British A:

Amsterdam Baltimore Casablanca Denmark Edison Florida
Gallipoli Havana Italia Jerusalem Kilogramme Liverpool
Madagascar New_York Oslo Paris Quebec Roma Santiago Tripoli
Uppsala Valencia Washington Xantippe Yokohama Zurich

[An 'international' alphabet in a Dutch telephone directory
has: Danemark. A 'French' alphabet in a Hungarian directory
has: Cassablanka Danemark Que'bec Upsala Zu"rich]

Used by police in New York City:

Adam Boy Charlie David Edward Frank George Henry Ida John
King Lincoln Mary Nora Ocean Peter Queen Robert Sam Tom
Union Victor William X-ray Young Zebra

[Variants: Eddie Larry Nancy Thomas Yankee Yellow]

Used by police in Nassau County, Long Island, New York:

Adam Boston Chicago Denver Edward Frank George Henry Ida
John King Lincoln Mary Nancy Ocean Peter Queen Robert Sam
Thomas Union Victor William X-ray Young Zebra

Used by police in San Diego, California:

Adam Boy Charles David Edward Frank George Henry Ida John
King Lincoln Mary Nora Ocean Paul Queen Robert Sam Tom Unit
Victor William Xray Yellow Zebra

Used by police in Hutchinson, Kansas:

Adam Boy Charles David Edward Frank George Henry Ida John
King Lincoln Mary Nora Ocean Paul Q.. Robert Sam Tom Union
Victor William X-ray Yankee Zebra

Sometimes used by radio hams (unofficial):

America Boston Canada Denmark England France Germany
Honolulu India Japan Kilowatt London Mexico Norway Ontario
or Ocean Pacific Quebec Radio Santiago or Spain Tokyo United
Victoria Washington Xray Yokohama Zanzibar

[Much variation: Amsterdam, Brazil, Baltimore, Chile,
Finland, Greece, Guatemala etc]

The ARRL (American Radio Relay League) alphabet (1948):

Adam Baker Charlie David Edward Frank George Henry Ida John
king Lewis Mary Nancy Otto Peter queen Robert Susan Thomas
union Victor William x-ray young zebra

[Nowadays the ARRL endorses the NATO/ICAO alphabet]

Allied Services 1945:

Able Baker Charlie Dog Edward Fox George How Item Jig King
Love Mike Nan Oboe Peter Queen Roger Sugar Tape Uncle Victor
William X-ray Yoke Zebra

From a book entitled "The Complete Morse Instructor..." (1944):

able baker charlie dog easy fox george how item jig king
love mike nan oboe peter queen roger sugar tare uncle victor
william x-ray yoke zebra

[The same alphabet is described as "Used by Armed services of
USA & GB" in the ARRL 1945 Handbook. Entries cited in variants
of this alphabet: affirm, cast, hypo, inter, negat, option,
over, prep]

Western Union:

Adams Boston Chicago Denver Easy Frank George Henry Ida John
King Lincoln Mary New_York Ocean Peter Queen Roger Sugar
Thomas Union Victor William X-ray Young Zero

British Army 1927:

Ack Beer Charlie Don Edward Freddy George Harry Ink Johnnie
King London Monkey Nuts Orange Pip Queen Robert Sugar Toc
Uncle Vic William X-ray Yorker Zebra

Royal Navy 1917:

Apples Butter Charlie Duff Edward Freddy George Harry Ink
Johnnie King London Monkey Nuts Orange Pudding Queenie
Robert Sugar Tommy Uncle Vinegar Willie Xerxes Yellow Zebra

U.S. Army 1916:

Able Buy Cast Dock Easy Fox George Have Item Jig King Love
Mike Nap Opal Pup Quack Rush Sail Tape Unit Vice Watch X-ray

Yoke Zed

With a sledge-hammer you could still modify it into a Frisbee.

Eric, I think you need to narrow down your question if you want to get a reply. There is just too much information. Although, in the USA there are almost no scanners that can still be modified for cellular. Maybe a Pro-2006 if you can find one. Start browsing FTP sites with radio mods to get an idea of what can be done.

>What effect (if any) would a 3db gain anteana have on a pro-51?

>The anteana is manufactured by Maxrod Inc. model number MFB-9153.

The effect of 3db is doubling the power of the signal you receive. Keep in mind that if the 3db is gained by the use of a tuned antenna, the gain will be over a narrow range of frequencies and not the entire band. A 3db broadband amp would give you gain accross the band.

With some HH scanners, more gain will only overload the scanner (they are designed to be used for the Duck antennas). THe the antenna you are referring to is a duck-type you will probably be ok.

>Thanks in advance,NCS

If they are mounted directly under eachother, most likely they will not interfere at all. But, if you have a metal mast running along the side the discone, it will alter its tx/rx pattern.

You're both right. I think the original poster was referring to *direct*
reception of shuttle comms, rather than GARC's excellent rebroadcast of
the NASA feed (which includes news tidbits and is a NASA-controlled
version of the ground-to-air voice link).

The technical details of the ground-to-orbit link have been discussed
here before.

It's easy. Just plug it into the audio output jack of your scanner and
then plug the output of the SS-70 into a speaker of better yet, some sort
of audio amp.

>>in that sort of communication. Check out rec.radio.shortwave - it appears
>>that several shortwave listeners heard the same conversation on some sort of
>>HF (shortwave) phone channel.

I heard some of these conversations on the night in question. It was via
shortwave on the Air Forces GHFS (Global High Frequency Service). Its
purpose is to provide reliable communications between ground and aircraft
There are many, many frequenices in use, worldwide, for this purpose.
Some observetions of mine.......
1) These conversations should not have been made on an unsecured comm-
unications network.
2) It was exteremly irresponsible to have reported it to CNN.
3) It was even more irresponsible for CNN to use this information as they
did.
First we had the press with their scanners, etc. repeating everything
they heard about the OJ chase. Now CNN with the Haiti conversations.
Obviously if it is "news", laws don't matter.
Doesn't CNN have an internet ID ? If so, please post it I like to tell
them what I think and I'd hope others would do the same. I guess the
words responsible and journalism are mutually exclusive to CNN.

Of course if you have a Yupiteru MVT7100, you have to search at 10 Khz steps and the Yupi stops 10 KHz short of the actual frequency a lot, causing me to hit the arrow key to get it right on frequency. This probably wouldn't happen if it had a narrower selectivity. Also, scanning at 5 or 10 KHz steps just slows down the number of cell channels you can catch per second. Some scanners default to 12.5 steps only allowing the user to directly lock on one out of every five cell channels; however, selectivity being as poor as it usually is, most channels are still heard rather well, even several KHz off freq.

Cross-posted to: rec.radio.scanner,rec.radio.equipment,rec.radio.homebrew

I've purchased a 7100 and I've heard about changing the PIN switching diodes for better performance.

Questions:
Which diodes do I replace with what, and where do I get the wonderful, new diodes?

Is it really worth the trouble to replace 'em?

I'm planning to use the radio for VHF/UHF weak signal with outboard, band-specific preamps (when I'm not eavesdropping on the cops).

I can probably figure out the which in the first Q, it's the what & where I'm really interested in. As for the worth, I'm interested in any/all opinions.

I love that little box,
Galen, KF0YJ

Subject: Air Fone Frequencies

This is a special mailing of an article too large for the regular
Digest.

From: Leroy.Donnelly@ivgate.omahug.org (Leroy Donnelly)
Subject: Air Fone Frequencies
Reply-To: leroy.donnelly%drbbs@ivgate.omahug.org
Organization: DRBBS Technical BBS, Omaha

A subject had been brought up on what the frequencies are used for
in-flight air-to-ground. The following should clear up the questions.

The FCC has issued rules on allocation of the 849-851/894-895 MHz
bands for air-ground radiotelephone service.

The new action, effective September 9, 1991:

1) changes channel spacing from GTE Airfone Inc.'s de facto standards;

2) orders GTE to make its service available to other air-ground licensees at non-discriminatory rates;

3) divides each channel block into 6 control channels (P-1 through P-6) and 29 communications channels (C-1 through C-29);

4) provides for a communications channel bandwidth of 6 kHz;

5) gives GTE 22 months to modify its current control channel scheme; during this period, GTE can use the lower 20 kHz of each channel block, which includes channels C-1, C-2, and C-3, for control. GTE then has another 38 months during which it can only use a 3.2 kHz control channel in channel C-2 of each channel block. After these transition periods end (September of 1996), GTE must switch to control channels marked P-1 through P-6 in the tables below;

6) empowers the FCC to assign exclusively one control channel to each air-ground licensee;

7) limits the ERP of airborne stations to 30 watts; maximum, and that of ground stations to 100 watts maximum;

8) limits the ERP of ground stations to 1 watt when communicating with aircraft on the ground.

GROUND TO AIR CHANNELS

(NOTE" "GB" in these listings denotes Guard Band, a series of 3 kHz spacings to separate communications channels from control channels)

> There are many, many frequenices in use, worldwide, for this purpose.

Is there a list, or range of frequencies?
Thanks.

>yet? If so how does it compare to the stock speaker?

My curiosity got peaked here so I looked into my pro51 and it has a
1W speaker (SP-326, 8ohms, 1W). I thought it sounded better than
most handhelds I've heard.

What scanner do you have? My RS portable CB radio has a
binaural jack, and I haven't been able to find the same on
a scanner yet. I had to snip off the end of my cassette
adapter, buy one of those you-build-it connectors, and
solder the wires to it.

Don't know about the Yupi, but the same is true of the Standard C558A and
there's no knocking its selectivity. Turning up the squelch doesn't help for
the obvious reason. The problem occurs only on the stronger signals. Turning
up the squelch causes all but the strongest signals to be missed.

>Cheers, Dave

Well Dave, if you want the listing of the standard phonetic alphabet as
used by most police departments, here it is:

POLICE ICAO/MILITARY

A ADAM ALPHA
B BOY BRAVO
C CHARLES CHARLIE
D DAVID DELTA
E EDWARD ECHO
F FRANK FOXTROT
G GEORGE GOLF
H HENRY HOTEL
I IDA INDIA
J JOHN JULIET
K KING KILO
L LINCOLN LIMA
M MARY MIKE
N NORA NOVEMBER
O OCEAN OSCAR
P PAUL PAPA
Q QUEEN QUEBEC
R ROBERT ROMEO
S SAM SIERRA
T TOM TANGO
U UNION UNIFORM
V VICTOR VICTOR
W WILLIAM WHISKEY
X X-RAY X-RAY
Y YOUNG YANKEE
Z ZEBRA ZULU

I hope that's what you were looking for.

>I'm not sure what antenna this is but the basic result of putting an
>antenna of more gain on the pro51 will be more stations, more images
>(from more stations) and more intermod from already strong signals.

>David

Adding gain will NOT necessarily increase interference or images. Gain on omnidirectional antennas is generally accomplished by lowering the angle of radiation, or "takeoff angle". If the source of interference is within the lower angle then it's apparent signal strength will increase with the antenna gain. While David's answer usually proves correct, it is not always true.

One thing you may notice after increasing gain is that antenna orientation may become more critical. But then again that will depend on where you are in relation to the stations you are listening to.

I wouldn't bother spending much money on higher gain antennas for handheld anythings. Higher gain usually means bigger. Bigger is usually more inconvenient. IMO, the tradeoff size versus gain isn't always worth it. I went back to the stock antenna on my FT470 transciever because I got tired of having the high gain antenna stick me in the armpit when the radio was on my belt.

2671. [FORSALE] RD PRO-37 handheld

Newsgroup: rec.radio.scanner
Date: 1994-09-22 23:48:41 UTC
From: jgeorge@crl.com
Message-ID: <35t54p$a43@crl2.crl.com>
Source record: 268460
Cross-posted to: rec.radio.scanner,ga.forsale

I don't want to do it, but I gotta do it...

For Sale:

Radio Shack PRO-37 handheld radio scanner

200 memories
30-54MHz, 108-174MHz, 380-512MHz, 806-960MHz bands.

About a year and a half old. Includes scanner, manual and NiCd batteries
(use an RS Universal AC Adapter for AC input or NiCd charging)

If sold in Atlanta I'll leave it programmed with my frequencies for you to
play with.

I'd like $150+shipping for it but I'll entertain any reasonable offer. I'd
like to sell this relatively soon.

Email jgeorge@crl.com if interested.

Thanks.

Re: AR 8000, can anybody help me with the following?:

+) Is it possible to use the scanner while charging the batteries (i.e while it's plugged into the wall outlet)? The manual isn't very specific about this.
+) I've heard rumours about some bugs in an earlier version of the AR8000. Although I haven't had any problems yet, I'm curious if I already got a patched version (my serial# is 011458 220).
+) My AR8000 seems to be quite deaf when using the out-of-the-box rubber whip. What's the recommended way to improve reception?
+) Is there any PC/Mac software available yet?

Overall I'm very impressed with its features.

TIA,
Marc

This is true with lots of scanners. Other Radio Shack models and
Uniden models also do this. But if you buy a triple-conversion scanner,
like a PRO-2006, (the PRO-51 is double-conversion) you shouldn't have
many problems with images...

You can use the scanner with the CD adaptor plugged in. But I'd suspect
the batteries will charge more slowly, if at all.

>+) I've heard rumours about some bugs in an earlier version of the
> AR8000. Although I haven't had any problems yet, I'm curious if I
> already got a patched version (my serial# is 011458 220).

Judging by the serial number I would guess that you have a specimen
from the current (third) production run. The CPU lockup bug (due to
stray voltage at a regulator) is fixed in this run. If you look at the
front PC board you will see a diode pigyback-soldered across a resistor
near the CPU. That's the patch.

>+) My AR8000 seems to be quite deaf when using the out-of-the-box
> rubber whip. What's the recommended way to improve reception?

I use the GRE duckie as a general purpose duckie. The Austin Condor is
better but very large. Or go to Radio Shack and get the center-loaded whip
which will also work for HF (the duckies do not).

>+) Is there any PC/Mac software available yet?

Not yet, but I know of some people feverishly working on this :-)

>Overall I'm very impressed with its features.

Yes, it's quite an impressive package. Certainly the best handheld AOR has
put their nameplate on.

Does this type of encryption involve beating the modulating sound
frequencies against a tone? If so it seems like I have seen these
at prior hamfests...

>
>Andy
>

Andy,,

I have also noticed this problem... If you turn the volume below a
certain level you get no line out.... Another even worse problem I
discovered was that the aux out did not close... I checked it out and
found that the center pin as well as the shield pin is soldered to the
board and there is no source of strain relief... Needless to say the
center pin had lifted the pad from the board.... I resoldered with
a junk resistor clipping (wire) and everything works fine now...
BTW It was delivered to me this way... Right out of the box,, brand new
and I called Bearcat and wanted to talk to a tech... but wasnt allowed.

Well, as a suggestion that i haven't seen before. What would
work flawlessly for you would be to takea commercial six meter antenna
and tune it as close to 46 MHz as you could. Cushcraft sells a 6 element
with 11.6 dBd of gain!!!! That is 11.6 dB of gain over that that a full
length dipole would offer. Front to back ratio on that particular
antenna is 26 dB.... that would easily allow you not only figure out
direction of a signal, but pick up signals at a much greater distance and
with better clarity. This antenna is designed to pick up 50 to 54 MHz,
but i assume that (not that it would be necessary) could be retuned to
precicely the nearby band you wanted.

CS>
CS> All of this dosen't even take some of the other features of the 2500
CS> in to account. Don't be too hard on the 2500, it is a good radio, and
CS> what scanner out there couldn't use some improvement.

Hi, Carl...
I do have a love/hate relationship with the 2500. I like the SEARCH speed. Works great when I want to find a freq in a hurry. Auto Search and store is great. 'Course, it takes 10 minutes to lockout all of the birdies during the search.

I am in the 'burbs of Chicago. Most of the time, I am fighting with the one of the dispatch towers 5 miles away. In the 800 Mhz range, there is some MDT freq that bleeds into what I'm trying to listen to or worse yet, locks up the scanner. I never had any of these problems with a '34 that I sold a year ago. It's frustrating, but gets the job done. Unfortuanately, this scanner needs more improvements than most.

Good signals to you...Jerry

RG> I am looking for mods for the bearcat 8500 scanner, can anyone help?

Hi, Russell...(Any relation to Al, our Vice President?)

No mods can be done on your 8500. This is the first Uniden unit that complies with the new law. Seems that Uniden had a lot of problems with birdies with the original chip and re-designed the chip. They decided to deal with the cellular band in the process.

If this isn't the mod you were looking for, what were you looking for?

Jerry

dd> shack scanner. I asked the salesmen and he showed me a new 1000
dd> channel scanner. He said that you can hook it up to you cable what
dd> ever that means. Does anyone know what he meant?

Hi, Donell...
Who knows what the heck an RS salesman means when he starts talking that
cr*p. Could mean anything.

There is a scanner that is made by Uniden for Radio Shack. I believe
this is the 2036, which is similiar to the 870XLT. (I think.) The 2030 is
also made by Uniden Bearcat.

What did you think about the 1000 channel unit? This is the model that
is replacing the 2006. It is made by GRE and is triple conversion. Lots
of people are complaining about the looks. (I don't think it looks bad.)
But the performance is where it is going to count.

Jerry

2690. What about RS Realistic 34?

TS> (2 years ago?) at Radio Shack... a Realistic (Pro?) 34. 200 channels.
TS>
TS> It's been working but, as this is my first scanner, I can't compare it
TS> to anything else.

Hi, Ted...
I owned a '34 for about 5 years. An excellent unit. I sold it to
someone at work for $150 with adapter, ni-cads and manual.

It is a slow version of a '39. Good image rejection except in the 800
Mhz band, modifiable, and an excellent unit for it's time. While no longer
available and state of the art, it is still a fine scanner that GRE
manufactured for RS as their first 800 Mhz capable handheld.

The '34 did have children...a Pro-37. The only thing different about the
'37 was a faster scanning rate. Everything else including the case
remained the same. Unless you are desparate for a new handheld, keep the
'34. It does the job.

Jerry

: Anyone know of one? Where? How much?

: --
: --
: | copeland@metronet.com |
: --

A recent issue of World Scanner Report had a simple mod where the IF
section in the PRO 2006 (455kz I think) was tapped and sent to the
antenna jack of a SW radio. The SW had SSB capability and was used as the
final reciever. This was being used to decode satellite SSB data in the
135 mz range. Pretty neat mod (used two pieces of coax and one capacitor).
I think it was in volume 4, number 7.
Till later, Si B.

2694. FS: PRO-34 Scanner

Newsgroup: rec.radio.scanner
Date: 1994-09-23 04:46:51 UTC

Message-ID: <35tmjr$8u8@bigfoot.wustl.edu>
Source record: 268344

Sorry to post here, but I didn't see a rec.radio.scanner.marketplace, so here goes.

This is a non-modified handheld Realistic PRO-34 Scanner, 200 Channel, etc. You probably know it all already. Anyhow, it was fun when I had time, but I don't anymore. So, I'm asking $225.00+shipping (obo). It includes the manual, flexible antenna and a telescoping antenna. It is a very clean and well-kept unit, I'll throw in the Michigan/Ohio Police Call 1991 (just because I don't need it anymore). If you want specs. drop me a line I'll send you the sales pitch on freq range.

pjblonsk@artsci.wustl.edu

2695. 2 way radio programming

John,

Modifying the Pro-39 is possible. Diode D6 just be removed from the third
circuit board (the board closest to the keyboard/speaker. Once you take the
back off the scanner, the two connection to the antenna need to be desoldered.
Then desolder the ground wire from the bottom right corner. Remove the
two wiring harnesses. Remove the 6 screws. Set the top board aside. Desolder
the ground wire from the left corner of the middle board. Remove the two
screws. Set aside the middle board. Desolder the four corners of the metal
shield covering the third board. Remove D6. Repeat the process in the reverse
order for assembly.

>I just ordered the above non-cellular blocked scanner, and was wondering what
people's opinion was of this purchase. Can you get a better scanner for $400?

I have had one for about 3 months. Find it suffers from intermod big time, esp. in my area near Bean Town. That more my fault that the radio's I guess. The manual sucks. Bought a guidebook that wasn't much better for $15. It's difficult and laborious to program; not at all intuitive to use. Can't seem to get certain functions such as locking out search bands to work regularly. Can't beat the price though. It's a lot of scanner for the money; I'm still trying to decide if I love it or hate it. There's no inbetween with that thing.

L>I;m looking for any frequency that has to do this the local 4 air ports
>they are westchester county airport,jfk, laG. and nework nj.
>If you can post then here it would help me out alot .Thanks again

I have these freq. for the 4 NYC area airports:

Westchester:
CTAF: 119.7
Unicom: 122.95
ATIS: 116.6 arrival; 133.8 dep
NY APP CON: 126.4; 120.8; 124.65
TWR: 122.95
GND CON: 121.8
NY DEP CON: 120.55
CLNC DEL: 127.25

JFK:
Unicom: 122.95
ATIS: 128.725; 117.7; 115.4 arrival; 115.1 dep
NY RDO: 115.9; 122.1
NY APP CON: 127.4; 118.4; 123.7; 126.8; 132.4; 134.35; 109.5
Kennedy TWR: 119.1; 123.9; 125.25; 132.4
GND CON: 121.9; 121.65;(125.05 gate hold)
NY DEP CON: 123.7; 124.75; 134.35; 135.9
CLNC DEL: 135.05

LaGuardia:
Unicom: 122.95
ATIS: 127.05; 125.95(arr); 127.05(dep)
NY APP CON: 120.8; 118.0; 124.95; 127.3; 128.8; 132.7
TWR: 118.7; 119.95; 126.05
GND CON: 121.7; 121.85
DEP CON: 120.4; 124.45
CLNC DEL: 135.2; 132.85(copter)

Newark:
Unicom: 122.95
ATIS: 134.825; 115,7; 132.45; 115.5
APP CON: 127.6; 132.7; 128.55; 132.8
TWR: 118.3; 134.05

GND CON: 121.8
DEP CON: 119.2; 120.15; 124.75
CLNC CEL: 118.85

Hope this helps,

JSS

Thanks for all the NY freqs - a great piece of info.

Would anyone happen to know what I might be hearing on 125.325. Generally, I hear routing information (like that of a center controller), but I can't figure out which center. Is there a New York Center?

They seem to primarily route planes over and around Long Island (ie: Islip, Deer Park, etc.). I hear terms like "proceed direct to Rouff intersection", but have been unable to locate Rouff on nav charts.

Anyone know what this is?

Has any Columbus area scanner enthusiasts picked up any
frequencies for the new Polaris ampitheater? Its too new to be
in the Radio Shack books. Someone asked me about them as I live
close enough to pick them up, but the last show of the year was
just the other night. Anybody have them?

Bill

> I think it was in volume 4, number 7.
> Till later, Si B.

This is a very nice mod. I documented how I did it a long time ago.
Here's the file for the mod.....

This is the mod for adding SSB capability to your Pro2005/2006. It is
taken in part from Bill Cheek's Scanner Mod Handbook Volume 1. As long
as you have a shortwave receiver with an external antenna jack and
capability to tune to 455 KHz, you can interface it to the Pro2006 with
this mod. It is best if you use a static safe work environment to
perform this mod and you should have some technical knowledge. Also, a
schematic would be helpful but is not necessary.

You will need the following parts:

Output jack (I use a 1/8 mini earphone jack but some like a BNC. The
1/8 mono jack is easier to install because you don't have
to drill as big a hole in the back of the unit)

.01 uF capacitor

5 Kohm resistor (1/4 watt)

6 inches of mini coax or other shielded cable

A cable to run from the 2006 to your shortwave. I use the shielded
cable that has the 1/8 plug on one end and a phono plug on the other

end (1992 catalog Radio Shack P/N 42-2444 works for me). The phono plug is perfect for the antenna input of my DX440 shortwave receiver.

The first step is to remove the cover of the unit and drill a hole in the back of the 2006 for your 1/8 or BNC plug. (You will want to wrap some tape around the drill bit about an inch from the end to keep it from cruising right on into the electronics once it punches through the metal!) Solder the 5K resister to one end of the .01 uF cap. Solder the other end of the cap to the shielded coax wire. Solder the other end of the coax to your 1/8 phono plug (or BNC) and ground the cable at this end. Now that the cable is in place you are ready to connect it to the 455 KHz source which is D33. It is on the top circuit board near the middle left, not too far from a huge capacitor. Solder the end of the resistor to the cathode of D33. (This should be the top of the standup part) Now you can test it out before you put the cover back on to make sure you did everything correct. You should be able to tune to some local airport or CB frequency on your 2006 and receive the same thing on your shortwave (with it tuned to 455 KHz and hooked up to the 2006 of course). If you tune something on your scanner that is SSB, you should be able to switch your shortwave to SSB and tune in the signal just fine. Beware of one thing, since the 2005/6 only tunes in 5 KHz increments minimum, you may notice from time to time that the signal on your shortwave isn't real clear. It may be that you will need to tune the shortwave anywhere from 451 to 459 KHz to tune in the signal well!

If you don't succeed or this description has you baffled you probably shouldn't be doing the mod in the first place. I assume no responsibility for screwups. Good luck

David

Well I suppose there are several minute exceptions largely depending on
RF environment, filters, antenna type, radio, etc. Still, the result
will MOST LIKELY be what I described above, especially with the pro51.
Of course, 3db isn't much but it may be enough to cause more problems
than good. I suppose I shouldn't have answered a question like this
with absolutes. Learning what antenna and what radio to use based on
what you're trying to listen to in a particular environment is not
something you can describe in one sitting at a computer terminal. It
is learned by experience. If this fellow is out in the country, he may
well benefit from more gain. If he's in the city, he may have
problems. My pro51 gets desensitized on 800 MHz pretty bad with more
gain applied.

YMMV,

David

2709. antenna for a pro 2006

Newsgroup: rec.radio.scanner

I posted this note a few minutes ago, but crashed when I sent it, so if this is a duplicate, just ignore this. Anyways, I have a BC210, BC250 and a BC210XLT. The BC210 no longer retains frequencies in its memory. At least I think thats what the problem is. The BC250 is *very* old but works like a charm. However, it doesn't receive the airline frequencies. The BC210XLT works great but I think I need an outside antenna for better reception. Is there an inexpensive antenna that I could buy that would pick up airport transmissions better. I live around 10 miles from our airport and can barely hear the control tower side of the transmissions. Can the BC250 be modified to receive aircraft frequencies? Is the BC210 salvagable??

So many questions, so little time.

Mike.

P.S. Does any have the frequencies for Pittsburg and Philadelphia airports?

>
Does UPS offer 2-day surface delivery to the Far-East... RS scanners for the most part are made by Uniden in the Pacific Rim!!! As AT THIS TIME it is not illegal to sell scanners that can pick up cell phones in Canada! This would make a logical place to send them. They would have to be further modified (fixed, locked out) for sale in Europe as other bands are banned elsewhere. With your strong US dollar vs the Canadian dollar valued @ $0.73 if these go on sale it would be well worth the trip north to grab one.

Well, the software still will run itself without hardware, if anyone curious about it. Just disable computer control, I think under option menu. It is very neat, but scans very slow on my machine(386DX33). It is great for monitoring a few local frequencies, but for me, scanning 20ch trunk, and a few other frequencies ScanStar Pro-edition is still faster. They all have their plus and minus.

Happy 'fast' scanning

Fu

you!!

Well As far aas I know and I am a manager at a Local Radio Shack, The
radio's were recalled because the Mods were available, the reason they
were pulled is that the Radios were MAnufactured after the Date set by
the FCC which said a modifiable scanner was no longer to be made. If
you have one of those scanners they can't do anything about it, period
end of conversation! In Repair or not, yes they might possibly replace
a missing or clipped diode, though if you sent it in under warranty, you
deserve to have it repaired and the whole thing billed to you.

I have tried using this demo for a while and I have to say I am not
impressed by the results I get. I have tried decoding from a number of
sources (microcassette recorder, scanner, microphone). I have tried
using an attenuating cable to direct wire the inputs to the mic,
tried using the mic (the stock one and my own), sampling the
tones with my MacRecorder/saving as AIFF, and synthesizing them
(as a last resort, for test purposes).

The decoder has never worked, save twice. One time I was using an
EXTREMELY clean recording of tones (studio quality), and the other
time I synthesized the tones using Soundedit. The interface is good,
very intuitive. I think that the separation and recognition algorithm
could use some work. It (TTD2.0) has no tolerance for noise or interference.

I suppose that this will offend the author, and I'm sorry. I'm just
telling it like it is. I do not claim I could do a better job, but I
want you to know that if you do, I (and many of my Mac using friends)
will then GLADLY purchase the program...

Regards,

Andrew

The programming software IS NOT freeware and in most cases is sold ONLY to bonefide two way radio dealers.
The cables however are sold to whomever is in need of them along with the serial port programming adapters.

Polaris Industries makes a respectible unit going for around a $100.00 plus around 38 to 60 for the cable from the programmer to the radio.

Of course we can't say where you can find the software under ground but I have seen some floating around so it is out there if you look hard enough.

The above company specializes in Motorola programming supplies BUT of course will not provide you with the software.

Cool. Trouble was, I couldn't remeber what *I* paid for the darn thing.
Considering its age and the amount of fun I've had with it, I don't mind
getting less than what I was asking (which was really a pretty blind guess).
Anyway, I will lower the asking price to $150 (and what the heck, I'll
bite the shipping cost too). Recap: PRO-34 Handheld
Scanner, 200-Channel, 2 antenna (flex and telescoping) and manual.
E-Mail for further details.

Thanks David.

Source record: 268292

I have a question regarding a test-mode for the Realistic PRO-43.
I understand that the PRO-39 and PRO-51 are capable of receiving
blocked freqs simply with a key pad combination that will place it
in a test-mode for Radio Shack techs to work in. While in the test
mode, a good portion of the blocked freq spectrum will be available
to scan, but not saved.

I know of only these two models that have this ability. Would anyone
know the test-mode for the PRO-43?

Message-ID: <1994Sep24.063530.8194@mixcom.com>
Source record: 268289

I am interested in buying a scanner.

I am currently attracted to the uniden BC220XLT but I know nothing about scanners or their various capabilties and applications.

I am begging for advice here.

Is there anything this scanner CAN'T do which, while I may not mind at first, will start to bug me after a while. Is there anything in a comprable price range which is better?

Also: How/where can I go for lists of frequencies and what they're used for and general info like that? Is there any ftp site around with text files? Do scanners generally come with pretty good user manuals?

I would first off be using it to catch local fire/police action in the hopes of putting together a photojournalism portfolio. So my first need would be for those frequencies in my area.

I am also curious as to why the vehicle mounted scanners always say "the use or possession of this scanning radio in a motor vehicle may be prohibited, etc.." and the hand held scanners never do. Are the hand held scanners limited in some way compared to the mountable ones? Why would having a hand held one in the car be ok but one mounted to the dash bad?

>
>P.S. I need frequencies for the Pittsburg and Philadelphia airports.
>Anyone know what they may be?
>

I still have an old Bearcat 210. Right about in the middle of the PC board
is a button cell battery, about 1/4" in diameter held in with a tiny screw
and a metal tab. Remove it, noting the polarity, and take it down to Rat
Shack and find it's replacement. Put the new battery and test for memory.
I have changed the battery twice in 17 years. My 210 seems to only lose
memory when the AC is unplugged while on.
If you want to get rid of it, let me know. Mine's keypad is worn to the
point of multiple keystrokes being entered.

Happy to hear about the AOR 2500 - I was thinking of buying one. I have a AOR 1000 and ahve been very satisfied with it as a scanner although it's not much on the SW end- I can get WWV for a tiem check. Low end- i.e. AM broadcast is next to worthless- I can't even get the strong AM broadcast stations!

As a scanner it performs right with the 2006 - I currently have both sitting on my bench side-by-side. If there are any differencies in performance they are very minor. In fact I'm returning the 2006 because it dosen't perform any better than the AOR 1000 and the 2006 isn't portable.

As to high end scanners- more expensive than the 2006 class- what is the best deal.

Opinions anyone?

Thanks.

Tom in Houton, TX area.

There is none; this only works on Uniden-manufactured scanners; not the
GRE-made PRO-43.

: Droid> We've had to send 4 models back. 20-504 (the pro 23), 20-305
: (the pro 46), and two others. If we sell them, we'd lose our
: job. They're (not sure which models) going back to the manufacturer
: to have a PROM changed.
: JW> I heard they're going up to Canada.
: Droid> I didn't hear that, but I guess it could be.
: JW> No way they'd replace a chip - too expensive.
: Droid> Even the ones in the repair cycle will get the new PROM, so some
: people will get brand new units, and their mod will be gone.
: JW> Not if people hear about getting their own unit confiscated.

: So there you go, folks. If your scanner is in the repair cycle, call your
: Rat Shak and insist on having your EXACT scanner fixed and returned to you!!
: They may fix "that broken diode", but of course, you could have another
: "accident" with wire cutters. =;^)

This is most interesting, I will inquire further into this, as it
would be fraud to replace the PROM if it wasn't the problem needing
repair.

It could get pretty expensive legally if the Rat Shack chose to take
this gamble, since a judge would most likely rule as he would in a
case where you took your car to be repaired, and they made "other
unsolicited and unauthorized changes". In such a case, the dealer
and/or service department can be legally required by law to put the
vehicle back to it's original condition as they received it fixing
only the item which required the repair.

Same with scanners, if they changed more than was needed to make
the repair, find one of your friends in the legal profession and
get them to write a nasty-gram (legal letter) to the Rat Shack
service department and return the scanner and letter to them for
restoration to original form prior to the "repairs".

Of course, if the question ever arose -- you will SUE them for
damages of your time, time off work, legal expenses, travel,
any other personal injury damages available (the inconvenience),
and the scanner restored to its original form.

If they still balk at that, you then have your "friendly" lawyer
send them another letter, this one certified, to where the scanner
was "repaired" at, the physical location of, and it should request
if they destroyed the components needed to restore it to the form

it was in before repair, they have also committed theft of items
not returned to customer and not legally theirs to keep. You may
optionally suggest they obtain an overseas replacement unit for
you -- since there was a capability of cellular before they modified
it to not be capable of doing so, and under ECPA rules, you use the
device for verifying signal radiation and interference.

By now, or sooner, they should respond with the old ROM put back
or an overseas model. In any event, if anyone has a problem of
this sort and follows through, I'd like to hear how much effort
(legal or otherwise) it takes to force them into putting it back
the way it was.

One other option of course is to determine the chip, and remove it
yourself before it gets serviced. This way you can put it back
when the unit is returned.

One other option as well related to the above (which Rat Shack
will HATE me for, I am sure), is to purchase a new unit, swap the
boards as to replacing the one that is broken, and swap the
chips -- then return the new unit with the faulty board and the
newer restricted PROM to Rat Shack for refund (duh, it did not
work well, it ... (fill in what it did wrong originally)).

This approach takes a little effort, but counters their new tactics,
and gets the repair done for free if out of warranty and guarantees
the modifiable cellular range will stay intact.

If anyone is interested, you have my permission to reprint this
article and to mail or fax it to your favourite Rat Shack service
department, regional sales manager, and anyone else who may benefit
of the solutions being discussed on what to do with their sleazy
unwanted PROM upgrade operation.

2740. Freqs. for High Schools?

Newsgroup: rec.radio.scanner
Date: 1994-09-24 15:16:53 UTC
From: Schoen@ix.netcom.com
Message-ID: <361ft5$qkf@ixnews1.ix.netcom.com>
Source record: 268301

Does anyone have any frequencies for the Catholic high schools in northern Virginia? Specifically, I am referring to Bishop O'Connell, Bishop Ireton, and Paul VI. Beyond Police Call lists Ireton as being 467.8125, but they do not list the other two. Is it possible that the diocese licensed that same frequency for all three schools but it is just listed for one? Would this make sense, since it is a low power splinter frequency and would not cause interference to the other schools? I have seen radios used by Paul VI staff at their football games, and I have seen O'Connell staff using radios around the school. The O'Connell radios appear to have UHF-High antennas. Anyone with any ideas or help please respond.

Thanks in advance,

David

Hi, Michael...
Bascially, it is tapping the signal off the IF of the scanner and feeding the signal to a shortwave receiver. Set the frequency of the shortwave to the IF. Set the shortwave to Single side band. Tune the single side band control until the inverted signal is restored.

I'm wondering if anyone has any experience with the Max 800 antenna advertised in Monitoring Times. Does it really perform well? And would I be creating a problem if I mount the base version of that antenna on a mast which already is topped off with a Radio Shack Ground Plane antenna, the big one, number 20-014? I can place the two antenna far apart, well, several feet, anyway. I'd put the Max 800 below the top of the mast several feet.

Any ideas, suggestions, recommendations appreciated.

Thanks.

: radio's were recalled because the Mods were available, the reason they
: were pulled is that the Radios were MAnufactured after the Date set by
: the FCC which said a modifiable scanner was no longer to be made. If
: you have one of those scanners they can't do anything about it, period
: end of conversation! In Repair or not, yes they might possibly replace
: a missing or clipped diode, though if you sent it in under warranty, you
: deserve to have it repaired and the whole thing billed to you.

Sooo, Jeff:

What you are saying is as quick as we can keep figuring ways to
mod the new scanners (ie PROM change, patches, jumpers, replacement
of components, boards, etc), Radio Shack is bound by some contract
with the FCC to pull the scanners off the sales shelf everytime
this occurs, correct?

Well electronic geniuses, we really need to keep D' Shack on it's
toes don't we... so let's figure a way to mod that new 1000 channel
base unit and make it go back into moth balls too! I mean as big
as Tandy is, they appear to have a LOUSY legal department. I would
have thought a business of that size to have had an attorney on
staff, who would be experienced. First it was the Police Calls in
New Jersey, now it's the "if the scanner can be modified, no matter
how hard it is, we will take it off the market" approach.

Personally, if the Rat Shack is not willing to fight it, perhaps they
might as well go out of the scanner business right now and start
selling stereos and tvs (ooops, be careful there, I forgot about the
UHF TV band!).

2749. New to scanning - have a few questions.

Newsgroup: rec.radio.scanner
Date: 1994-09-24 23:51:03 UTC
From: wchsnews@aol.com
Message-ID: <362e17$q3c@newsbf01.news.aol.com>
Source record: 268306

The other day I started playing with one of the scanners at work (actually, I was trying to get the cheese out from around the keypad) and stopped it's scanning routine, which has been uninterrupted in the year I've worked for the company. In my efforts to start it again, I pushed an arrow key and found myself listening to other people's voice pagers.
As has been stated in other people's posts, I was "hooked."
So, I decided to dive into the hobby, but only into the shallow end of the pool. Picked up a Radio Shack Pro-50 to see what the hoo-ha is about, and I'm very pleased, and so was my wallet.
The point is, I want to know if there are any modifications for the Pro-50. I see many for the '43 and a few for the '51. It has the leading "A" on the FCC ID, and if the rumors hold up, is unable to pick up cellular calls. However, I would like to restore the missing parts of the bandscan, like the aircraft frequencies. Any ideas? I intend to open the thing up tonight and take a look for things I've read about in the '43 modification documents. If you can think of something specific I should look for, let me know.

I occasionally hear harddrive/monitor hum & other noises on certain freqs b/c my scanner is only 10 inches away from my monitor and about 3 feet from my CPU. It's not noticable on most freqs and certainly not bothering me enough to feel a need to move it- EXCEPT, I was thinking today- I have an All-band antenna pulling in the signal- will having the scanner up next to my computer have any effect on the scanner's reception... In other words, will it pick up less, more, or about the same signal as it would placed away from my computer...?

Thanks In Advance!

One of the people I know with a scanner (actually, the only other person I know with a scanner), recently bought a mini-tape recorder with VOX (VAS or whatever else it's called) in order to record the cordless phones in his neighborhood while he's away. After a brief discussion (all of 2 seconds) we concluded that neither of us knew the laws related to this practice; that is, beyond the fact that we "can't tell others what we heard." I understand that different laws likely exist in different regions, but does anyone care to share what the laws are in that area? Much appreciated...

Cheers, Dave

The majority of the interference from the computer and other electronics around the house usually make it directly into the radio itself because of the plactic enclosure.

Assuming you are already using an external antenna, the only fix will be to move the scanner or redress the computer cables a bit.

If you are currently using the built in antenna, you well see a dramatic improvement with an external antenna because of the distance from the source AND the improved signal capture ability.

Note however that broadband noise will still be able to enter the radio directly. But obviously not like it does with the antenna close to the computer too.

As an experiment, try removing the built in antenna (unscrew it) and see if the computer noise goes away. If it does, an external antenna some distance away will be fine too.

I see lots of Radio Shack bashing here. They aren't that bad. OK, the salesmen/saleswomen may not know all their products. But just think about it for a second. Radio Shack carries THOUSANDS of products, with quite a bit of that stocked right in their stores. I doubt there are many people out there who would know the ins and outs of every product they sell. I sure don't. I may know a lot about their computers or radios, but may need some help with their video gear. So I agree. The salespeople don't know all their products, and I'm aware of that. I also know, that if I'm going to buy a new electronic gadget, I should know at least something about it. Any buyer should. This holds true if I buy it at Radio Shack, or buy it somewhere else. So whatever people say about Radio Shack, I still will shop there. It may not be the best place in the world, but they often do have sales on selected items I may want, and often have items that I would find hard to find anywhere else...

The laws are pretty much the same everywhere reguarding receiving cordless phones and any other public service frequency.

You can do about anything that you want (but you cant use the onfo for personal gain or in fact even tell others what you have heard)
S you can record, transcribe or anything else.

Now then there are the cell phones which of course you cant even hear at all right ??!!..... :-)

By the magazine called RADIO! at Radio Shack. It comes out quarterly,
and is only $1.95. Lots of basic info about radio in it, along with
some info on products they sell. In it should be a general table of
where stuff is in the radio spectrum. It's on page 53 of the Spring
issue, which is the last issue I have, but is a bit too lengthy for
me to type here.

They advertise that book, and have it in their 1995 catalog, but I have
yet to find a Radio Shack in my area that stocks it. I guess I'll
have to have one order it for me, or call 1-800-THE-SHACK, starting
Oct. 1st, which allows phone-in mail orders.

> this occurs, correct?
No That is not what I am saying at all. The Scanners in Question, were
manufactured with a very simple Mod built into them, that was 1 easy to
access, and 2 built after a specific date and SHIPPED, this was A No-No.
So Instead of risking fines and other legalities by the FCC they pulled
the scanners off of the shelves. And yes they are bound by some contract
to follow the rules of the FCC, otherwise they would not be allowed to
sellany of these products.
For example, if you are a HAM radio operator do you have a license? If
you answered YES, why? Is it because the FCC says so? Your damn right it
is. It's part of the rules you agreed to follow to be able to use the
products. Why do the HAM radios have limits on them? Because it is FCC
mandates. Also why are Linear RAdios illegal? Hmm Tough question it isn't
because people didn't want to use them? Try FCC rules and regs on
transmitter strength... Try looking at the legal side from a retailers
point of view instead of some lame consumer who thinks scanners fall
under the freedom of information act instead of the right to privacy act.

I use a 2026 in my company vehicle. I use a mag-mount antenna, and I also have homemade 15" whip mounted inside, on the "cage" that seperates the cab of the van and the cargo area. I use a cable A/B switch to switch to the inside antenna when driving in the shadow of Mt. Pagertone. Though there are some pagers that wipe out the 425.000 area, even with the inside antenna, a cause for NOT mounting an external speaker right behind the driver's seat.

Jeff,

It's quite obvious that you're a "manager" at Radio Shack judging by your comment that consumers who buy from Radio Shack (and help pay your salary) are "lame". Your attitude is a typical Radio Shack company man attitude (ever heard of a lemming). It's also obvious that Radio Shack employees are not hired for their technical abilities but on how much they can BS the customers into buying at overinflated prices. It's a real insult to those of us who have spent years in the technical field (22 to be exact for me) to have someone who is supposed to know what we are talking give us a cock and bull story and ask us to buy it. What bothers me is what about the poor unsuspecting general public that Radio Shack has made untold millions of dollars on because "technical" sales person sold them something they didn't need? And don't tell me it doesn't happen , because it does everytime I go into Radio Shack.

Does "You've got questions, we've got answers" sound familiar? Well I got a question! When is Radio Shack going to stop trying to BS people with how much they know and start trying to treat customers with respect? Thank God some of us are of sound enough mind to question what our government does and not follow every beck and call that same government puts out just because they said it. Maybe you're not old enough to remember the lesson our government taught us with Viet Nam, but I am. I lost a lot of good friends over there because some "lame" politician told us we had to do it and we lost anyway. And for what? So some lame Radio Shack manager could spout the official government/Radio Shack propaganda line? Not if I have anything to say about it.

Put that in your government/Radio Shack approved pipe and smoke it! You can smoke without permission can't you??

Generally, its okay everywhere in the USA to record from the scanner so long as it is for your own personal use and you don't play the tape for others (unless everyone was sitting around listening to an incident while it was being recorded, and then that same group listens to the tape...that's okay, because everyone heard the same stuff, so you're not "divulging information"). The only exceptions that I know of are you can't record cellular phone calls, because the ECPA of 1986 makes it illegal for you to be listening to them in the first place, likewise for most pager calls. In addition to that, I imagine that in New York, California, and New Jersey (and probably by now a few other states too) it would be illegal to record cordless phone calls, because those states have laws that make it illegal for you to be monitoring cordless phones at all.

Also, I don't think you can use the information you have on the tapes for monitary gain.

And everyone please note this. In the words of Star Trek's Doctor McCoy, "Dammit Jim, I'm a computer programmer who just happens to have a few scanners going all the time, not an attorney!" so take what I said above the same way you would take a janitor telling you how to clean the engines on a space shuttle. Its correct as far as I know, but I offer no guarentees.

[Article crossposted from alt.radio.scanner]
[Author was Jeffrey Starin]
[Posted on Sun, 25 Sep 1994 05:16:24 GMT]

I have just constructed the CE-232 computer interface and find it pretty good overall. However, I have a couple of questions and thought maybe someone in this group may be able to help me out. Specifically, I keep seeing references within the user-contributed scripts available for use with the CE-232 on the Hertzian BBS about versions of the software greater than 1.0. Does anyone out there have such an animal? I also see references to a command - bank - which is supposed to turn on and off various banks on the 2006. It doesn't seem to work on my setup. And would anyone know of a script which would scan or search and log hits to the reject file or memory or somewhere, and on subsequent passes not log that frequency again, over and over? It seems to defeat the purpose if you keep getting the same frequencies piling up and have no way of stopping the size of your file from growing larger all the time.

Well, that's it - write to me here or privately with any suggestions or comments. And write to me if you are considering buying this device and would like some honest opinions about its performance.

I happen to test software for a living, and well, have to admit that I am impressed with the performance overall, but there is certainly room for improvement.

Get them while they last!!! Don't buy any RS scanners, why modify when
you can buy a better radio that you don't have to modify!! I recently
purchased a Uniden Bearcat Sportcat. The instructions informed me
that my radio would not receive cellular phone frequencies.
However, while playing with the search function I discovered the radio
covers the entire 800Mhz band!!! 806.0000-956.0000 narrowband, which of
course includes the cellular phone freqs. I purchased it at Service
Merchandise in NH 9/22/94 for 197 bucks. It's a great radio!!!
Obviously either the mfg or the FCC has made a gross error, so get them
before they catch on to their little mistake. Have FUN!!

The laws don't use the word "tell" or any of its variations. They usually
use "divulge" which covers any way you care to come up with to distribute the
information.

I've found that if you clip the wires that feed the internal speaker,
it does wonders for the squelch. I've not noticed any static on
any freq since I've done this.

However, I've not been getting any "hits" lately. Could it be related?

What this SWLer did is technically illegal to begin with. Any communications intercepted by him, not intended for him, is illegal to divulge to a third party from my understanding. And also, I believe this sort of communications could come under the protection of the ECPA in that it is a communication not intended for the general public to hear. I think this SWLer is in bigtime trouble if that CNN guy ever discloses his source. Someone offer up some opinions on this. 73.

I am not an electronics whiz... far from it! But I *did* manage to
install the OptoScan456 in my 2006 - and it worked the first time!
However, I spent 3 (often frustrating) hours in the process.

Before you start, make certain you have needle nosed pliers, cutters
and double sided foam adhesive mounting strips (all of which can be
found at Rat Shack).

Notes on various steps:

(2.3) Use the cutters to enlarge the hole, not a screwdriver. Otherwise
you'll likely destroy the insulation on the wires leading to the
battery clip.

(2.4) *DO NOT* remount the battery at this point. It will interfere
with removing and reinstalling the transformer. Do it as the
very last step prior to putting the covers back on.

(3.1) The instructions tell you to detach the wire braid ground, but
never tell you to reattach it! I used a screw to secure it to
its original position after performing step (3.2).

(3.4) The strips slide on by feeding them from the edge.

(5.0) You'll need the needle nosed pliers to hold the hex nut in place
while you thread the screw.

(9.1, 9.2, 9.3) You don't have much free play - it's a tight fit.

(9.4) I didn't trim the connectors and got them to fit and had no
problem getting the covers back on the unit when I was finished.

(10.2) THIS M.F.er TRULY TESTED MY PATIENCE!!! Between expletives and
deep breathing relaxation techniques, I did get the sucker in
in place.

In the final analysis, all the frustration was well worthwhile. The
Scan*Star software installed easily. If you have a modem, download
their latest version from the BBS number they provide. The software is

fast, but the features are barely adequate. I'd be tempted to upgrade to Scan*Star Pro if I could pay an upgrade price. But if you got the software with the OS456, they won't discount the Pro version. I downloaded Radio Manager (for windows), but it's slower than snail slime. I admit that I'm using an underpowered PC (386sx/20 laptop w/5 meg), but Scan*Star (DOS) runs fast. Maybe I need to tinker with the config in Radio Manager.

Anyway, good luck with your installation!

My guess is that the manufacturer didn't make a mistake. The scanner
was apparently made before April (when modifiable scanners were still
being made for sale in the U.S.). Someone probably bought your scanner,
tried it out, modified it, and then returned it to Service Merchandise
for some reason. Service Merchandise then inspected it, saw it was still
in perfect condition, and then resold it. I strongly doubt that the
people in the Service Merchandise return department know to check to
see if a scanner returned was modified, considering all the other
products they sell and have to worry about.

You don't even have to open the scanner to achieve that result. Try cutting the electrical cord. Works equally as well. Although I don't suggest cutting it while it's plugged in with an uninsulated pair of wire cutters. :)

2784. BC-100XLT parts layout? HELP!

2785. Scanners with a line out?

Newsgroup: rec.radio.scanner
Date: 1994-09-25 14:50:32 UTC
From: pgunn@alkali.otago.ac.nz
Message-ID: <pgunn.248.780504632@alkali.otago.ac.nz>
Source record: 268245

Can anyone give me the names of some scanners that have a line out? I'm not just after a headphone socket, I want one that only comes live when there is something being said (maybe I'm trying to say vox activated ?). With a wee relay controlling it I guess. Or names of some scanners that are easily modified to perform such a task. Hints from those that have performed such surgery would be nice.

Email replies as my news feed has packed a sad recently. (8 days no feed).

On a slightly different note, some of the services in my area are switching from AM to a Narrow FM. This would normally be a good thing, but the word on the street is that their NFM is going to be narrower than the standard NFM to fit more into the band.

Does anyone have any comments for me about listening to it apart from 'It'll be quieter than normal on rhe NFM setting on your scanner'? Are there any scanners that have a WFM, NFM, and Very NFM setting out there? The way the channels are going to be allocated has adjacent channels a long way apart geographically, so that's one worry out of the way.

Thanx in advance. Happy scanning.

Zerxes Bhagalia (v064lnev@ubvms.cc.buffalo.edu) wrote:

...huge list of ticket-avoiding kit deleted...

By the time you've fitted all that to your car, the extra weight will probably prevent you exceeding the limit anyway :-)

I have a radar detector. It's great for detecting all sorts of stuff: traffic light triggers, automatic door openers at any store I drive past, and all sorts of other things I haven't identified yet. In other words it is going off all the time, yet I have never actually detected a police radar with it. Then again, they don't use them much around here. I haven't bothered to take it out of the glovebox for months.

CB can be useful for avoiding speed traps; I have received timely warnings on several occasions. If you monitor channel 19 you will hear the truck drivers passing advice on road conditions and this sometimes includes details of "smokey" activity. But it's more common to hear about accidents, roadworks and traffic jams, which is very useful. Of course, it only works well on roads that are frequented by a lot of truck drivers. It is also often very effective for asking directions in unfamiliar places.

By the way, your hoped-for 50 mile range is out of the question; a mobile CB setup is doing well if it reaches 10 miles reliably. Less if you are suffering from interference from the ignition, etc. More if you are talking to a base station rather than another mobile. Depending on how much of a fool you are prepared to look, it is possible to do a bit better by fitting an enormous antenna. But you don't really need long range for traffic checks, as they tend to be from people coming past you travelling the other way, rather than people who are currently at where you are heading.

mx> around 10 miles from our airport and can barely hear the control tower
mx> side of the transmissions. Can the BC250 be modified to receive
mx> aircraft frequencies? Is the BC210 salvagable??

Hi, Mike...Sounds like the reason the 210 won't hold memory anymore is a
battery that is dead. The 210 I have here uses a 323 watch battery. Later
210 productions put the battery on the back panel of the unit. The older
ones (which is what I have) requires you to disassemble the unit to get at
the battery. It is in the center of the motherboard with a metal clip
around it. Replace the battery will solve your 210's amnesia.

Sorry, I can't help with the other 2 situations. But I do think that the
210XLT reception should be alot better. Especially if you are able to pick
up transmissions on the 210 and not the 210XLT.

PL> I am looking for the cellular and cordless phone frequencies. I would
PL> appreciate any assistance with these.

Hi, Paul...
Listening to cellular phone calls is against US federal law. So the
frequencies you will want to avoid is 869-894 Mhz and 824-849 Mhz.
Cordless phones monitoring is illegal in the states of New York and
California. If you are in these 2 states, the frequencies to avoid are
between 46.61 and 46.97 Mhz. They are also scattered around the 902-928
Mhz range, usually scrambled in one form or another.

They may hire him/her, as long as the individual posesses some sales
ability.

> (2) The trained engineer, who always knows which 10 cent resistor or 2 buck
> connecter the customer needs for a particular application.

I doubt a highly-trained engineer would want to waste his time selling
stuff for low commissions at a Radio Shack.

> (3) The quick-talking BS artist who knows jack about electronics, but has
> a knack for pushing stereos, computers, and extended warrantees.

I have to admit, they always try to sell me the extended warranty. I
see them enter my sale in their computer/cash register, and the thing
always tells them on the screen to suggest the extra warranty, so there
is no thinking required on the part of the salesperson. A couple months
ago, I bought an item that was marked down to $49.00. They tried to
sell me a warranty on that that was about $45.00. I sort of laughed.
I mentioned I could just about buy another product for the price of
the warranty.

Anyway, whether you're buying a radio, a car, or a house, know what
you are buying and do some research first! Otherwise you may end
up buying something you later regret. You can't blame everything
on a 'sales droid'. ...Let the buyer beware..

That's about right. Grove Enterprises (800-438-8155) is selling their lasts also at that price, if they haven't done so already. If you want to buy a new 2006, do it now, because you'll never be able to do it again.

Not true. It isn't illegal to posess any such equipment. In fact,
such capable equipment is still being sold! But although it isn't
illegal to posess a cellular-capable receiver (there are probably
millions of them out there in American homes) it is technically
illegal to monitor cellular calls. The latter, is a law that you
have that is next to impossible to enforce. What are the
"scanner police" going to do? Go into every American household and
watch so they don't scan the 869 - 894 mhz range? And what are the
"scanner police" to do with images of cellular telephone calls, which
often appear on cheaper scanners, even though they might not even
be cellular capable? This stuff is unenforceable. The laws that
are coming from Congress these days is enough to make me throw-up...

2807. Re: Legality of recording scanner output?

>this practice; that is, beyond the fact that we "can't tell others what we
>heard." I understand that different laws likely exist in different
>regions, but does anyone care to share what the laws are in that area?
>Much appreciated...

The Canadian law (Radiocommunication Act) states that (in layman terms)

- Scanners/Scanning legal anywhere in Canada

- No "OFF LIMIT" frequencies (RE: cellular freq's)

- No license required

- Do not use what you hear for personal gain.

- Do NOT tell others what you heard.

So, as long as he only plays the tape for himself, and no one else,
there should be no problem with recording the conversations.

BUT, it would be awful tempting for him to let his buddies listen if
he hears something really outrageous. But he shouldn't have many
problems. We don't have a real big problem with "scanner police" up here

50 miles too far..???? Come'on guys, 150+ no skip, seen it, done it,
did it..... Get a REAL "illeagal" setup and just suffer the consequences..
i.e. burnt-out ECM Computers, Totally destroyed tape deck heads, and even
a few shorts from melting power wires....

You want 50 miles, get a Work truck with a carburaetor and no
radio (amFM).. Or, be prepared to buy "REAL" 10 meter amplifier equipment..

Radar detectors, won't do you much good with all the spurious
harmonic emmisions from a "cheap" amplifier for your cb.. Might even
get interference from a stock cb radio even.. Valentine one...JUNK.
Falses like crazy...

Go read a CAR & DRIVER (<--hahaha) Magazine for RADAR detector info..

or try alt.radar.falsing or something...

Chris

>one IF it will improve my situation. I have an All-band antenna and a
>PRO-2006.

The problem with most wideband amps is that they amplify the noise and all those oh so lovely paging signals along with the desired signal. Thus, they are usually useless. However if you have an outdoor antenna and place the amp _right_at_ the antenna, you may get some improvment on upper VHF and UHF signals that get attenuated in your feedline. Make sure you can turn it off when listening to strong signals. Ideally, you would first filter out all but your desired band of signals, then use the amplifier. For scanners, though, it's impractical to have a filter for each band.

I too would be curious, though, to hear about anybody's experiences with two Radio Shack amps that look somewhat interesting:
(1) 10dB inline cable tv amp (covering 30-470? MHz) ~$20
(2) 20dB inline satellite amp (covering 430-1450 MHz) ~$30

Wrong answer, try again. In the United States you are violating no laws until you are actually listening to a cellular call in progress. It doesn't matter what equipment you own...it doesn't even matter what frequency is showing on your scanner. If I punch, say, 875.280 into my scanner and let it sit there, I am still not in violation of *ANY* law until an actual conversation starts. And then it doesn't matter how you are hearing the call. It can be on the actual frequency, it can be on an image, it can be changed to another frequency with a converter, you can be listening to the tape that your cousin Billy Bob made, it doesn't matter. If you are listening to a cellular call in any form, you are in violation of the ECPA of 1986.

Now, how they plan to enforce an unenforcable law like that is anyone's guess.

Is there any "official" word if these were discontinued overseas
and Canada as well, also the cellular status of the new 1000 channel
unit is still to be determined for non-US market units.

To re-cap past comments, most base units in the UK can be used in
the US using a 13.8v DC converter for power and the mobile connection
for power on the scanner. Canadian units can be directly used.

While there are some who say you can't legally import them, there
is no one going to stop you either and there has not been even ONE
stopped (so far). Reasoning is possession is not illegal, and there
are reasons that go beyond the wording of the law that would be
acceptable purpose for import -- legally. They won't risk a legal
headache for customs since if I wanted one strictly to place in a
glass case on display, not use -- and the term use is the normal
intended use of the device, in this case, used as a listening device,
the purpose of display would not be in violation of any (present) law.
If they were to delay its arrival and attempt to stop it, I could sue
them for the unit AND my expenses. When done, they would have a
highly publicised and lost case which they would rather not try
their luck on.

So such comments as "you'll never be able to do it again", may be
a slightly bit overdoing it a bit, and not 100%. There is a company
in Canada which guarantees delivery of cellular capable products or
you do NOT pay, and that is in print in Monitoring Times. With the
guarantee in print, you have nothing to lose and plenty to gain.

Get out your plastic, stick your middle finger at the FCC.

If it passes my airspace, I have a right to monitor it and if it
contains any statements which would not be considered normal
acceptable broadcast material (obscene language), I should have
the right to file complaint with the FCC and have the cellular
provider's license pulled as fast as any other transmitting radio

station would, I mean these ARE transmitting devices.

Well, if it's Charleston, S.C. you're in, you could stop by my X wife's
place and do some *research* for me. She has a cordless phone and a
baby monitor :-) :-)

|>I asked awhile back about people's experiences/opinions of signal
|>amps/boosters. I only had a few postings but none that discussed
|>experiences or models/prices or anything. I really am considering buying
|>one IF it will improve my situation. I have an All-band antenna and a
|>PRO-2006.

|The problem with most wideband amps is that they amplify the noise and all
|those oh so lovely paging signals along with the desired signal. Thus,
|they are usually useless. However if you have an outdoor antenna and place
|the amp _right_at_ the antenna, you may get some improvment on upper VHF
|and UHF signals that get attenuated in your feedline. Make sure you can
|turn it off when listening to strong signals. Ideally, you would first
|filter out all but your desired band of signals, then use the amplifier.
|For scanners, though, it's impractical to have a filter for each band.

|I too would be curious, though, to hear about anybody's experiences with
|two Radio Shack amps that look somewhat interesting:
|(1) 10dB inline cable tv amp (covering 30-470? MHz) ~$20
|(2) 20dB inline satellite amp (covering 430-1450 MHz) ~$30

I knew someone who tried a Rat Shack cable tv amp with his PRO-2004 &
Grove Discone. Didn't help at all. Problem with these Rat Shack CATV
amps is that they have a HIGH NOISE FIGURE -- the 1st RF amplifier
in the receiving system controls the system noise figure. Assuming
that the person is in a relatively quiet RF location, he would
want an RF amplifier with a low noise figure. The RS unit had a 5db
NF.

He might want to try out the wideband amplifier sold by Ham-Tronics;
unlike the ham band RF amplifers they sell, this one isn't a Gallium
Arsenide-type, but a regular bipolar type. Check out any of the amateur
radio rags like 73 or QST and ask for a catalog. The wideband RF amp
isn't advertised in the magazine ads; price is around $60. Has a very
low NF.

Cross-posted to: rec.radio.scanner,alt.radio.scanner

|I'm wondering if anyone has any experience with the Max 800 antenna
|advertised in Monitoring Times. Does it really perform well? And would
|I be creating a problem if I mount the base version of that antenna on a
|mast which already is topped off with a Radio Shack Ground Plane antenna,
|the big one, number 20-014? I can place the two antenna far apart, well,
|several feet, anyway. I'd put the Max 800 below the top of the mast
|several feet.

|Any ideas, suggestions, recommendations appreciated.

I'd say that you're wasting your money! The MAX 800 as I recall is simply
a ground plane antenna cut for 800 Mhz band, thus, you could emulate
it's performance simply by placing your scanner on a metal table
with it's standard telescopic whip antenna.

My suggestion is that you emulate one of the discone antennas being sold
in the United Kingdom. To provide good antenna performance across a
wide frequency range, instead of a single loaded whip antenna on top of the
discone, they use several whip antennas on top seperated by a small
distance... can anyone supply the requisite hardware requirements to
mount additional vertical elements on the Rat Shack Ground Plane?

I found mine on 902.40. It is supposed to have 30 channels, but
there is no manual way to switch channels, and it always seems
to come up on 902.40 Maybe it will only switch if there was
interference.

2833. Blue/green frequencies?

Newsgroup: rec.radio.scanner
Date: 1994-09-26 16:47:07 UTC
From: karayan@blitzen.cc.bellcore.com
Message-ID: <366tub$kpf@blitzen.cc.bellcore.com>
Source record: 268189

Damark's latest catalog features a pair of walkie-talkies that it calls
"2 channel VHF transceivers." The catalog goes on to say that the tranceivers
"feature 2-channel operation on the blue/green frequency." What are those
freqs? Do I need a license to operate the radios? And last, but not least,
do you think that 1 watt on those freqs would go through a quater of a
mile through trees and houses? If not, what would you suggest I get?

Thanks in advance.

Strange. I have had very little trouble decoding touch tones off a
radio with this program on my Mac LC. In fact, the only problems I see are
false positives generated by noise or other background sounds and
misdiagonsis of weak tones. Otherwise it works pretty well. The author
has told me that it doesn't work on "newer Macs" that don't use a 512 byte
sound buffer. Maybe that is contributing to the problem. He told me that
he has had a poor shareware response and would only continue work on the
project if interest demanded it :-(. Anyhow, I will forward your comments
to the author.

Regards,
John

Apologies to everybody for using "bandwidth" but if I may just make a quick plea to someone (Hopefully!)....

I received some mail over the weekend from somebody asking for info on the PR-150 but due to technical difficulties (ie. I Cocked Things Up) I have lost that piece of mail and cannot for the life of me visualise the name in the sig.

Many apologies to the person concerned but if you are reading this and would care to "jog" my memory I would be grateful - and sorry for the trouble !

Thanks.

Source record: 268192

Going the opposite direction, I have heard some cool sounds
coming from my computer (a Sun SPARCstation 2) when my
scanner is nearby. You can usually tune your scanner to
some multiple of the CPU frequency and hear stuff. Let's say
you have a 486 running at 25mhz. Set your scanner to some multiple
of that (like 50, or 150 MHZ). You can even sometimes hear noise
as you move the mouse across the screen. Wierd. Even wierder
is listening to the sounds your machine makes when it boots.

OK, OK, I don't get out much.

Mike

Hi there!

I'm another guy new to scanning. Friend of mine introduced me to it, and soon enough, I ended up buying a Pro-51. Lotsa fun! :)

I am wondering if anybody has the freqs on which the Motorola HT600(?) operates on. If so, could you drop me a line through e-mail? Thanks.

Dave

: 15 or 3 work on a full scale with 1 volt.
: THanks
: Steve

Use the 3volt dc meter and get a couple of 'risters'. The risters should
be of X and 2X value and placed in series. The voltmeter should be
attached in parallel to the rister of value X.

This should work.

You do need a license, they should send an application with the radios.
Frequencies:
RED: 151.625
BLUE: 154.570 I've heard McDonalds drive-thrus on this freq
GREEN: 154.600
WHITE: 462.575
BLACK: 462.625
YELLOW: 464.550

I got this list out of a catalog.

>It is amazing how ordinarily inteligent people can overlook the obvious.

Look in the mirror & say that.

>The intercepted signals came from HAITI, a whole 'nother nation. The FCC

Really? When I heard the call, I kinda got the impression that
SAM 58-6972 was some sort of aircraft --maybe even a C-137B-- and was
a few hours out from their refuelling stop in Puerto Rico, headed
back to somewhere in the US -- perhaps Andrews Air Force Base in Camp
Springs, Maryland.

I also kinda got the impression that the ground station --
"Andrews" was probably a USAF 89th Communications Group facility
located in Building 1558 at Andrews AFB, MD & using a remote
transmitter site on Ascension Island, or maybe Fort Allen, Puerto
Rico, among others.

But you're probably right. Both "Andrews" and "SAM 86972" were
operating on HF from the sovereign nation of Haiti. Yup!

>and/or
the US Congress has no jurisdiction over radio waves in other >countrys.

I didn't think we had any jurisdiction over anything going on in other
countries, but since that didn't stop us from going in to Haiti, you
might want to also reconsider your last statement.

What with all the RatShack bashing having occurred lately, I thought I'd relate this.

I stopped into one of the local outlets over the weekend. I looked at some merchandise I was contemplating getting, but then handed it back to the salesperson and told her I would like to take just the new catalog today. She reached under the counter, peeled a sticker I never saw off the front cover and said "Here you go!". I was very surprised, having fully expected to pay, happily thanked her, and left the store.

Maybe there's hope, or maybe this local outlet is a notch above the average one.

Actually the ECPA doesn't care about HF or public service.
Only cellular and pagers.

However the Communications act of 1934 is where you will find the
restriction on divulging what you heard to anyone.

I find this interesting in that I am a rabid nascar stock car fan and
there is an entire cottage industry out there selling the frequencies and
updating them on a regular basis.

The tv commentators listen in all the time for insight.

Not only that, every team listens to the other teams to play strategy
games. and sometimes fakeouts with each other.

fun fun fun

From: malxndr@aol.com
Message-ID: <367go2$9gg@newsbf01.news.aol.com>
Source record: 268204

Thought some people might find the following excerpts from a Motorola press release interesting:

Sept. 22 -- Motorola's Cellular Infrastructure Group (CIG) introduced its new radio telephone system called INReach that enables a person to use a cellular phone to place and receive calls anywhere within a building or campus-like setting. The phone can be used as a desk phone extension or in place of a desk phone for highly mobile employees or temporary on-site users. Since INReach interconnects with the building's PBX system, typical cellular user fees do not apply. A centralized radio architecture and revolutionary digital interfaces differentiate INReach from other products on the market. Unlike other wireless in-building systems that typically distribute numerous base stations to provide coverage, the INReach system centralizes the radio functions and uses a distributed passive antenna system. A passive antenna system allows for higher quality, ubiquitous coverage. The typical system configuration can support over 2,000 subscribers (with as many as 119 voice channels per base station). INReach interfaces are via a digital or analog interface to any PBX or Centrex system. Virtually all digital phone features such as call forwarding, three-way conferencing and call transfer are supported.

Source record: 268207

There is a keyboard mod around for the Pro-23. In this file it states to press 2,9,manual keys at the same time. It neglects to tell you it wipes out your memories. It supposed to do something with the 800mhz but it gives you the following 13 frequencies. None of which is out of band, None of which will let you search out of band. So for some odd reason there programed there. Maybe there in there for the shop to test the basic reception across the entire band.

Those frequencies are as follows:

CH.#: Freq:

1 140.000
2 155.000
3 170.000
4 410.000
5 460.000
6 510.000
7 109.000
8 118.000
9 127.000
10 135.000
11 810.000
12 860.000
13 950.000

I hope this is of help to all of you who own Pro-23s 50 channel scanner. Happy scanning

I just went to Radio Shack today, and found that they were still selling the good old 2006, pro-39, and 43. The sales guy was really nice to me, and he immediately started telling me about all the mods that can be done on these models so as to pick up cellular. I was amazed to find that the prices on these old models had dropped about one hundred dollars. I was seriously thinking of buying a pro-39 or 43 from them, but I should be receiving the BC2500XLT from Damark in a few days. The sales person was very interested in this new scanner, and he asked me if I could bring it in to RS so that he might be able to play with it. He told me he was a ham operator, and he was very helpful with edumacating me concerning the band coverage of their scanners and those of cellular bands, and the cellular skip to the other frequencies. While we were playing with the pro-43, we picked up a cellular call right in the store, so he quickly put on a better antenna, and told me to listen quietly. I guess some RS sales people are really okay people.

Whoa... Motorola software is NOT freeware, and they even have a 1-800
snitch line to turn in people who have pirate copies of it. Watch It.

Most Icom stuff is either keyboard programmable, or requires a special
programming (not pc) box and cable.. like the U-10 U-8, etc. for about
$300 a pop.

As for Motorola Ribs, there are dozens of manufacturers of Ribs and
Programming cables... Ask on rec.radio.forsale or something like that
for suppliers.

buck
>connecter the customer needs for a particular application.
>
>(3) The quick-talking BS artist who knows jack about electronics, but
has
>a knack for pushing stereos, computers, and extended warrantees.
Actually they prefer all three since if you know nothing about
electronics you aren't going to get very far in the Company ,second the
Salesperson has to know about ALL products to be able to sell the person
coming in saying I need this dohicky, at which point the Salesperson asks
to do what. ALso it's too bad you guys live in a place where your radio
shack people obviously have very little knowledge or any sense of reality
like a customer is too stupid to know the difference between rg-6 and
rg-58/u besides the number. Because in the store I work in my fellow
employees and myself find it easier to tell the customer the truth or if
we have no idea what the hell they are really trying to do, will send
them somewhere to get what they really need.

One other thing before I get off my soap box, If you don't like
the staff or the products stay out of the store, if you don't you
obviously don't feel that bad about shopping in the stores and at which
point I would ask that you stop wasting bandwidth with your whining and
crying. Shop Sears for a scanner, if you can?

Sorry to burst your bubble, but the Secret Service uses encrypted HTs
when
the President is around. (At least they did the last time he was in
San
Francisco.) Vice President Gore gets the same treatment.

So, by the way, does the FBI. I was on a search (and rescue) with them
and because of the media using scanners each team had an FBI agent with
an encrypted HT.

> using.

You'll hear morse code on many frequencies. Stations are required to identify themselves and CW is legal for id regardless of the usual mode of transmission. Many (most?) stations choose CW for id so that it doesn't get in the way of the voice transmissions.

Check the usual sources, i.e., pub/hamradio/mods/<manufacturer> at
oak.oakland.edu
The ususal warnings apply, for example, the FT530 can be modified for out of
band reception, but has only 12.5kHz stepsaround 870MHz or so. A HT can serve
as a "scanner" if there are only one or 2 channels you want to monitor, but
otherwise is a poor substitute for the real thing. (Just my $0.02)

This sounds odd. (1) The 43 requires a hardware mod and (2) it's very good at
image rejection. Could it have been a cordless phone?

->
-> I hope this is of help to all of you who own Pro-23s
-> 50 channel scanner. Happy scanning
->
-> Michael J.Hogan
->
-> Personal Computer Traing INC

I was the person who gave Michael the incorrect information. I must apologize for the confusion. I guess I got so flustered I gave out the incorrect test mod. The CORRECT (I just tested it again to make sure it was correct) mod is 2, 9, and LOCKOUT while turning on the scanner. This also wipes all of your memory locations but gives you the following frequencies:

Channel-Frequency
1-138.150

2-162.400
3-173.225
4-406.875
5-453.250
6-511.9125
7-108.500
8-118.800
9-127.1750
10-135.500
11-157.800
12-482.3625
13-806.000
14-857.200
15-888.960
16-911.500
17-954.9125

The last 3 or 4 are out of the normal coverage area for the PRO-23 and will allow you to scan up and down in the full cellular range. Hope this helps. C-ya, Lee.

Do remember the context in which it was used? It could be something official like "Police Dog Search" unit. But police also use official sounding talk for their little jokes like NHI is No Humans Involved, meaning the people involved weren't the kind of people most people would hang around. If that's the case, it PDS unit could be the drunk wagon or "Publicly Drunk & Stupid". I'm just guessing though. I used to be a dispatcher and even then it's hard to keep up with all thelingo floating around. Do you remember the context?

: the standard mod posted elsewhere and everywhere. Have a ball!

: Steve

I bought my Pro-46 in Jan. of this year, and it has a "10A3" sticker on the back (significance?). However, before you try clipping any diodes, etc., try the keyboard mod posted here earlier (it worked for me :-).

If you read the manual you know that holding the 2 and the 9 key while you turn the unit on will clear all memories. However if yo hold down the 2,9, and L/OUT keys while turning the unit on, you get a factory test mode that fills your first 25 memories with freq.s. The two most interesting freq.s are ch.15 (76.825 MHz) and ch.23 (888.96 MHz). Neither of these freq.s are in the scanner's normal range. You can move them to a different channel using the monitor function, and scan these new ranges in the manual mode. Best of all, no soldering!

Happy Scanning

Why bother? Most if not all scanners have a limiting circuit (two diodes back
to back) in the antenna input, which keeps harmful voltages out of the front
end. If you just don't like the noise the scanner makes on transmit, turn it
down or off.

Yes, but it CAN be quite amusing... sometimes you can get past the hovering salezoids and be left to browse with something like "I'm building a DOUBLE BALANCED MODULATOR and I need some parts!".

Some salezoids hover much more than others...

Many folks (who follow r.r.s) heard both the in-flight transmission and
Bernie's questions to Carter later. This is not an neturban legend.
CNN will not reveal their sources. They frequently use both
professional and amateur monitors for tips. A few years ago they even
did a story on one of their professional monitors, a very intersting
gentleman indeed. BTW, they pay $$ for these kinds of tips which
explains why someone spilled the beans.

Uhh. Excuse me? My OKI900 is prefectly capable of receiving "cellular traffic". And I don't mean just when I using it to talk to someone else. Many cell phones can do this. And for your information cellular capable receivers (scanners) and test equipment are still _legally_ being sold in this country. According to the best estimates of the cell phone industry there are currently more cellular capable scanners in the US than there are cell phones.

Source record: 268130

Spectrum Guide: Radio Frequency Allocations in the United States, 30 MHz-300 GHz, will be available in November from New Signals Press, 800 460 0090.

It's not a scanner book per se, but a detailed review (250+ pages) of radio allocations, historical-political status and forthcoming changes in the VHF thru EHF bands. It does include who is allowed to do what in each of the 300+ bands in that range.

It's based on the U.S. table of allocations and the table's official footnotes, but goes beyond that with narratives.

It includes some of the offbeat stuff, such as Public Emergency Radio (aka Decision Information Distribution System, DIDS); Space Shot at 900 MHz; Personal Emergency Locator Transmitter Service (PELTS); personal radio at 31 GHz and others.

Spectrum Guide is directed not really to the hobbyist but to the professional/technical user. It has an index and index to bands. Price: $34.95 + 3.00 s/h. That's for book rate shipping (4-6 wks); there are other ways to ship.

don't forget the NEW 220-222 MHz business band. Scads of licenses are being issued - look in the new USSN state books and its full of them. Haven't heard sigs yet - but they're coming!@

I am attaching some very active frequencies for Vancouver and Victoria,
British Columbia which I have taken from various frequency books.

VANCOUVER FREQUENCIES

POLICE FIRE AMBULANCE

143.025 150.635 149.110
143.085 151.505 149.320
143.385 149.590
143.565 414.175
143.685 414.187

AIRPORT WEATHER FERRIES

118.400 Tower 162.400 153.740
118.700 Tower Seaplanes 162.425 155.410
120.500 Arrival/Departure 162.550 155.850
120.800 Arrival/Departure 155.910
121.700 Ground Control
122.200 Flight Service and Harbour Tower
123.150 Flight Service
123.200 Heliports
124.000 Tower
125.200 Miscellaneous
126.700 Flight Service
132.300 Flight Centre
133.700 Flight Centre
134.800 Flight Centre
413.2875 Miscellaneous
460.200 Miscellaneous

VICTORIA

R.C.M.P. AIRPORT AMBULANCE

140.310 119.100 Arrival/Departure and 142.095
140.370 Hospital Heliport 149.210
140.400 119.700 Tower 149.590
140.610 121.900 Ground Control 158.835
141.150 122.200 Coast Guard/Hospital Heliport
141.180 123.200 Harbour
126.200 Flight Service Hospital
126.700 Coast Guard/Hospital Heliport
130.275 Hospital Heliport
133.850 Miscellaneous

2891. Re: Should I buy a BC220XLT?

Newsgroup: rec.radio.scanner

>I am interested in buying a scanner.

>I am currently attracted to the uniden BC220XLT but I know nothing about
>scanners or their various capabilties and applications.

>I am begging for advice here.

>Is there anything this scanner CAN'T do which, while I may not mind at
>first, will start to bug me after a while. Is there anything in a comprable
>price range which is better?

the 220XLT is a very nice scanner and I'm sure you will be happy with it. In
fact, I find myself using my 220 more than my 2500XLT - maybe its the size.
The 220 is a very full featured scanner. It is only dual conversion, but
images are not a big problem. In its price range, there is nothing better
(around $240).

The problem with generally favorable reviews is that when a really good product comes along, how is one to know? Well, in his review of the 2035, BG says, comparing it to the 2006, "circuit performance is virtually identical, although FM broadcast reception is somewhat imporved over its predecessor. And the additional features justify the $50 price increase over the old model." But it would have been nice if LM, in his mini-review of the Black Box Antenna devoted a sentence to how it compared to the Select-A-Tenna.

Also, Bob's Tip of the Month has nothing to do with extended receive! Is this what I'm paying my hard earned money for? :-) [It's a joke, son . . . er, and daughter . . . oh, the heck with it!]

2893. Introduction to Scanning

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

This introduction is intended for people new to the scanning hobby and is oriented to scanning in the USA. It tells where you can buy your first scanner, what features it should have, where to get it repaired if required, how to get frequency information, and mentions a few scanner clubs worth joining.

Why Scanning?

Every day and night, scanner hobbyists are entertained by what they overhear on their radios. Police cars, fire engines, ambulances, armored cars, trains, taxis, airplanes, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Listen in the 46.61 - 49.97 MHz range to your neighbors deal drugs over their cordless telephone, or as their conversations are picked up and transmitted over the airwaves between 49.67 and 49.99 MHz by their sensitive baby monitor intercom.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots.

Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

You can even listen to the order taker's wireless microphone at the local McDonald's restaurant on 154.6 and 35.02 MHz!

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the ECPA. Change is in the wind -- when existing stocks are depleted, it will be illegal for companies to sell scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted laws against listening to cordless phones, but it's currently legal to listen in most states. You can find out about these restrictions in a 39 page paperback, ANARC Guide to U. S. Monitoring Laws, compiled by Frank Terranella, available for $7.50 from ANARC Publications, P.O. Box 462, Northfield, MN 55057.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners bear the Realistic label but are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend many of the AOR | brand scanners.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies

into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners almost always provide more audio than portables, and portables are usually more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band unless you live in a very rural area where this band is not used. Usage of the | 800 - 950 MHz band is growing fast and you will miss | out on the action unless your scanner covers this | band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 16 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often poor.

Deluxe scanners can be controlled by a personal computer, although this feature isn't important to many scanner owners.

Currently, the more popular scanners include the Uniden/Bearcat 760XLT (a/k/a 950XLT) and Radio Shack PRO-2006 base/mobiles, and the Uniden/Bearcat 200XLT (a/k/a 205XLT) and Radio Shack PRO-43 portables. A number of | owners report problems with the Uniden/Bearcat 8500XLT and | 2500XLT and new replacement models are rumored.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so. Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801, can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be somewhat more prone to lightning strikes because they are not at "DC ground."

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, | sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- Marymac Distributing (Katy, TX) sells Radio Shack scanners at discount, but charges a 20% restocking fee for returned merchandise. Telephone (800)231-3680 and (713)392-0747.

- Scanner World (Albany, NY). Telephone (518)436-9606.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Many ham radio dealers, like Amateur Electronics Supply (Milwaukee, WI, (800)558-0411), also sell scanners.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

If you are handy with a soldering iron, you may be interested in modifying your scanner to add features or enhance its performance. Be warned this usually voids your warranty. Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

ftp.cs.buffalo.edu
garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and stocks parts for several older models. G & G sometimes buys old scanners, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores.

I also recommend the book, Monitor America, 2nd edition published by SMB Publishing, and available from Grove Enterprises for about $25. This single edition contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed

communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's 168 page Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 6th edition is available from Grove Enterprises for about $19. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and Kneitel's sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. It will likely disappoint experienced scanner hobbyists and is better suited for beginners. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the | public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The DOS access software is somewhat difficult to use and the frequencies are displayed with annoying leading zeroes.

Grove enterprises sells FCC license information on floppy disks. Disks for each state are sold separately, and the information is basically the same as the FCC "state sort," i.e., transmitter location (state/city), callsign, licensee name, and type of license. Some hobbyists find Grove's DOS access software is easier to use than the PerCon CDROM access software.

Over 15% of the FCC licenses, including many fast food | restaurants, contain transmitter latitude and longitude but specify no transmitter city. To determine the location of those transmitters requires using the latitude and longitude information.

I developed a process which produces a color map of FCC licensed and selected FAA transmitter sites in an area, given a center location (latitude/longitude) and a range (in miles). I call this new innovation a RadioMap(TM). It | allows you to identify antenna sites (including paging and cellular phone cell sites) and visualize the transmitter locations in your neighborhood, near your office, at an airport, and other places of interest -- from VLF through microwave. Streets, rivers, and ham radio stations are not shown as they would clutter the RadioMap. RadioMap includes key sheets which list frequencies, callsigns, and licensee names. In rural areas, ranges of up to 10 miles are possible, while ranges of 1/2 to 2 miles produce best results in urban cities.

Currently, I can produce custom color 8-1/2" by 11" RadioMaps, suitable for framing or laminating, only for | areas in Illinois, Indiana, Wisconsin, Michigan, Missouri, | New York, Ohio, and Pennsylvania. Send $19.95 ($16.95 + $3 | shipping) for each color RadioMap, your name, address, and | telephone number, along with center location (lat/long or | nearest intersection of 2 streets) to: Bob Parnass, 2350 | Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM | central time.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio users to identify their operations with their assigned call letters, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several

days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $24.00 per year, which includes the monthly RCMA Journal, which consists of approximately 95 pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

AOSC questions can also be sent electronically to:

rccons!aosc_hq@telerama.pgh.pa.us or
dave.marshall@f240.n108.z1.fidonet.org.
FidoNet: 1:108/240.0

AOSC also has a MEMBERS & EDITORS Scanner related echo, AOSCNet, distributed via FTN on 6 BBS systems, and via Internet Mailing list. Rick Christian advises these strict rules for the AOSCNet Scanner Radio Echo (as of 2/1/94):

1. No discussion of cellular modifications or discussions on how to monitor cellular transmission.
2. No discussions on topics which would violate the ECPA '84, TDDRA '93, (18 USCA 2510 et seq.) or Communications Act 1934 & 1984 as amended (47 USCA 705), i.e., decoding/reception of paging, cellular, encrypted stuff, descrambling etc..
3. No Aliases.
4. No discussion of Shortwave or Amateur Radio material (except SAREX).

For info on the ECHO only, contact:

R.E. Christian, AOSC PA/AOSCNet Founder
PO BOX 12763,
Pittsburgh PA 15241-0763.
FAX: 412-831-5860.

rccons!aoscnet_hq@telerama.pgh.pa.us
rick.christian@f220.n129.z1.fidonet.org
FidoNet: 1:129/220.0

To receive a file of info on the All Ohio Scanner Club via Internet send to: rccons!ftpmail@telerama.pgh.pa.us

In body: get aoscinfo.zip

This will send a UUENCODED info packet to you. The file contains an outline of the material you will find in the American Scannergram, the AOSCNet, and an application for membership. (Note: This file will not be sent back to *.fidonet.org addresses.)

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members sometimes sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $10 check, payable to Kim Moran, to:

The Command Post
attn. Kim & Ted Moran
6143 W. Touhy Avenue
Chicago, IL 60646

Many CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (708)852-1292.

Here is a tentative meeting schedule for the remainder of 1994. All meetings will be held on Saturdays at the Destiny Restaurant, 1440 Rand Road, Des Plaines, IL:

October 15 *
December 10

Bring a notebook and your appetite.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

I am often asked, "How do you find these frequencies?" Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books

The most convenient source of fire and police frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores for under $10. Police Call is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. Later editions have included a few pages of local airport and nonsensitive federal government frequencies.

I highly recommend Richard Barnett's 1992 book, Monitor America, published by Scanner Master Corp., and available from Grove Enterprises for about $25. This second edition is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the world's largest scanning club, the Radio Communications Monitoring Association (RCMA). Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Beyond Police Call, available from several sources including Radio Shack, covers the business, schools, and other stations not covered by Police Call, its sister publication. One volume covers the entire USA, but no call signs are shown.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The second edition is about 400 pages and is available from Official Scanner Guide. The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $20. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is the best book in print for this difficult to obtain information.

A more accurate, but smaller and less comprehensive book is Midwest Federal Frequency Directory. It was published in 1986, and copies are getting scarce. Copies may still be available for $10 from Scan America.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells the information on PC floppy disks for each state instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The DOS access software is somewhat difficult to use and the frequencies are displayed with annoying leading zeroes.

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

Over 15% of the FCC licenses, including many fast food | restaurants, contain transmitter latitude and longitude but specify no transmitter city. To determine the location of those transmitters requires using the latitude and longitude information.

I developed a process which produces a color map of FCC licensed and selected FAA transmitter sites in an area, given a center location (latitude/longitude) and a range (in miles). I call this new innovation a RadioMap(TM). It | allows you to identify antenna sites (including paging and cellular phone cell sites) and visualize the transmitter locations in your neighborhood, near your office, at an airport, and other places of interest -- from VLF through microwave. Streets, rivers, and ham radio stations are not shown as they would clutter the RadioMap. RadioMap includes key sheets which list frequencies, callsigns, and licensee names. In rural areas, ranges of up to 10 miles

are possible, while ranges of 1/2 to 2 miles produce best results in urban cities.

Currently, I can produce custom color 8-1/2" by 11" RadioMaps, suitable for framing or laminating, only for | areas in Illinois, Indiana, Wisconsin, Michigan, Missouri, | New York, Ohio, and Pennsylvania. Send $19.95 ($16.95 + $3 | shipping) for each color RadioMap, your name, address, and | telephone number, along with center location (lat/long or | nearest intersection of 2 streets) to: Bob Parnass, 2350 | Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM | central time.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA)1. Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'2.

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13. |

Two way radio equipment formerly used by the armed forces | often appears for sale at hamfests. Less often, Secret | Service and FBI radios appear there from time to time, too. | When you see such equipment, look over the radio for a | frequency label and write down the frequencies stamped on | the crystals or channel elements. Make note of any service | or property tags which specify the agency or military base | which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists

about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are collected annually, which covers a monthly newsletter, the RCMA Scanner Journal, about 95 pages long. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. A recent liberalization of club policy now permits the printing of most federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542
Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

The real challenge is deriving new spectrum usage information. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

More about sleuthing will be discussed in Part II of this article.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?
Part 2: Sleuthing

by Bob Parnass, AJ9S

Part I of this series discussed how scanner enthusiasts can obtain frequency information from books, government microfiche records, or other listeners. This installment discusses digging up new frequencies on your own.

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are

given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by

dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described in Part I of this article, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi

antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

|The problem with generally favorable reviews is that when a really good
|product comes along, how is one to know? Well, in his review of the
|2035, BG says, comparing it to the 2006, "circuit performance is
|virtually identical, although FM broadcast reception is somewhat
|imporved over its predecessor. And the additional features justify the
|$50 price increase over the old model."

The BIG question though remains unanswered: are CANADIAN versions capable of being restored to cellular w/30Khz scan? Any Canadians out there with an answer now that the scanner is out? And is the 2035 EQUALLY susceptible to intermods as the 2006 in urban areas? The 2004 whilst insensitive stood up pretty well to the AWFUL PAGER transmitters (DEATH TO PAGERS!!!!) whereas the 2006 was crunched on at least the 460Mhz Chicago police... and when will they ever install "S-Meters" on these top-of-the-line Rat Shack scanners? I'd pay $10 more for one...

Well , title says all. I want Bill's modification handbooks vol1 and vol2
I'll take them used or new. Any publishers numbers where I can get this?
Any scan freak out there done with their copy ?
I want these books and I want them now !!
Any help would be appreciated.

But from what I've heard, it's some sort of AM sideband, similar to SSB (I'm sure someone can clarify this technical point for me) and unless you have a scanner that picks up SSB, you won't enjoy scanning these freqs much. I'll be using my MVT7100 or my pro2006 with the 455HKz line out to my SW receiver.

That's transmitted gain (what we amateur radio operators are concerned with
most).

What you didn't mention was the gain on receive comes from the increase in
aperature, ie; a resonant antenna that is 'X' times the size of a ducky
will deliver X times the received signal to the receiver front end (not
taking into consideration phase cancellation at the higher freqs (UHF on up).

George,
The blue dot freq is 154.570 MHz, green dot is 154.600 MHz
(going by the Motorola specs).
I will tell you right now that these are 2 of the most common VHF
business band freqs. They are used at many McDonalds for the
drive-thru headsets. Also, they are commonly used by many other
companies as well, especially in the retail sector.
My suggestion would be to get a scanner (I saw you have a ham
callsign) or some suitable receiver and check out how much traffic you
will have on these frequencies in the area you plan on using them.
As for licensing, I believe they must be licensed, even at just 1
watt.
As for enough power...I think you may have some problems. One watt is
not a lot of juice. I just tried running a 154 MHz portable through
similar conditions (at 1 watt, both portable radios inside the house
in a semi-hilly suburban residential area). The result was a very
scratchy, almost unreadable signal. Not to mention, this was on a
private channel (no other transmitters interfering). What you may want
to do is try tests on 2 meter ham bands (if you are licensed).
I will post another article listing some of the color dots and their
corresponding frequencies later on today.

I agree that impedence plays a part.
I started this thread by replying to wb9omc@constellation.ecn.purdue.edu
(Duane Mantick). I would guess that any digital signal in any
commercial product save a PC would work with a jumper. PC's clock at 33 Mhz
and more. I'd be comfortable jumpering, oh, 20 Mhz. Maybe more.
Anybody know what the familiar scanners clock at?

JS> Specifically, I keep seeing references within the user-contributed
JS> scripts available for use with the CE-232 on the Hertzian BBS about
JS> versions of the software greater than 1.0. Does anyone out there have
JS> such an animal?

If you purchased your CE-232 from Bill Cheek, you should have 1.3. I purchased one a couple of months after they came out and it came with 1.0, but it was less than a year when 1.3 came out. According to my manual, version 1.3 came out 01/16/93.

I also see references to a command - bank - which is
JS> supposed to turn on and off various banks on the 2006. It doesn't
JS> seem to work on my setup.

The number keys are used to turn the 10 scan banks on and off.

And would anyone know of a script which
JS> would scan or search and log hits to the reject file or memory or
JS> somewhere, and on subsequent passes not log that frequency again, over
JS> and over?

Run LOGTOUT.SCR. That's exactly what this script does.

Good Signals,

Randy

I got mine at Ham Radio Outlet (1-800-854-6046). Frequencies are listed
by state - but not broken out by city within each state. I can't say
that I've been particularly impressed by it - especially since there
is no cross reference by frequency.

Why did you post anonymously, unless you are a COP or got this from one?

Anyway, I notice the obvious fact that Nepean uses different detailed 10 codes and Ottawa uses a (IMHO) a horrible mish-mash of a few 10 codes followed by a single letter, which they all too often forget and mispronounce anyway.

Kinda representative of the differences between the two departments, eh?

Opps, maybe I should post anonymously!!!!!!

Message-ID: <369qus$a06@usenet.INS.CWRU.Edu>
Source record: 268154

Since all of this discussion has come up on the Pro 51 I
thought I would put in my two cents worth. I bought a Pro 51 about
a month and a half ago and had it about a week before I returned it.
The reception on the scanner was good and the sound quality was
average. The hyperscan, keypad layout, and display were also
a commendable design. However, the annoying beep, and tons of
images combined with the annoying squelch tail after every
transmission forced me to return it. It seemed no matter how
much I turned up the squelch I would still hear the Chhhppp
on every channel.
In the mean time I have my old Pro-42 which suits me just
fine, I'll keep waiting for RS to come out with their new triple
conv. handhelds.
Anybody else with the same story please post!

Happy Trails

Can my scanner (a Pro-37) receive a true CW (A1A) transmission? I've picked up id's in Morse code from Ham repeaters, but I thought those were generated tones sent out on FM.

The reason I ask is because I'd like to receive the slow-code and fast-code practice sessions sent out by W1AW on 147.555 MHz. Problem is, I've never been able to get anything. I've not been able to receive W1AW voice broadcasts either, so maybe I just need to get up on a hill or replace the rubber duck with something better.

Your scanner can surely pick up a A1A signal just as it would any other
unmodulated carrier. But all you will hear is the keying of the carrier
unless you have a BFO. W1AW is in Newington, CT - is someone carrying their
code practice on 147.555 in Washington state? Or are you expecting to hear
147 Mhz signals from Connecticut? Probably not going to happen.

Dave, I think you are hoping for a bit much to receive W1AW on 147MHz in Vancouver, WA. -- There are lots of code practice programs for computers kicking around; perhaps that would help you. You could put the output onto cassette tapes, if you don't have a computer available where you want to practice.

This reminds me of something we are looking at adding to our club repeater, which doesn't get a whole lot of use (the 440 repeaters around here are fairly quiet most of the time). We are looking at adding code practice which could come up at specific times/days, and also be brought up with touch-tone access; the latter would probably be limited to club-member access. I'm wondering if people in netland who are interested in learning code would find something like that useful. Comments?

I was confusing the 39 and 43. The 39 was $219.95 and the 43 was $349.95 at
my local RS. So $449.99 is still too expensive. You should return it or tell
them that you will order it from some other RS. I mean $100 is $100.
Sorry about the confusion.

From: hiattd@MCS.COM
Message-ID: <36ag59$7mg@Mercury.mcs.com>
Source record: 268164

Hi!

I have went to several local RS and they told me that the pro-51
could not be sold because it was "defective" and that a modified
model (different crystal?) would be available soon. So my question
is, will the PRO-39 pick up the same range as the unmodified pro-51?
I would like to purchase my first scanner and would like any
hints about which to get. The PRO-39 is $219. Does anyone have
a better scanner that I should look at. I really want one like
the pro-51 with its unique 800Mhz features. :)

Also, are there any other scanners that lend themselves to
modifications? Thanks again, any help would be greatly
appreciated...

don
hiattd@mcs.com

P.S. Funny thing about the PRO-51 is that each RS has a *COMPLETELY*
different explanation of why the must be "repaired." I actually
got the truth at one store. Imagine that! :)

147.555 MHz is VHF, line of sight propagation. Are you near Newington, CT?

> ,--.
> | / |
> | Dave Munroe / Hewlett-Packard |
> | dmunroe@vcd.hp.com / Vancouver, Washington |
> | / |
> `--'

Guess not.

It will be all but impossible for you to receive W1AW's VHF transmissions
if you're in Vancouver.

Some repeaters have audio Morse Code practice... Perhaps you can check
with local repeater clubs to find out if it is available in your area.

Good luck!

73, Andy

O.K. I got the power cord clipped and the cover comes off much easier
without the other 2 wires to the speaker attached, but now the tubes
won't glow anymore. Did I miss somthing?

Heck, owning a cellular phone could be illegal too. Nuts & Volts has
run articles on how to put some OKI and Motorola hand helds into scan
mode.

The reason you can't, is that VHF is line of sight, so if you're farther than
20-50 miles (since W1AW is in Connecticut..), you won't be able to hear it.
Look for a cheap shortwave radio at a yard sale, with a "BFO" control.

Actually I've heard the dispatcher say "10-11 fight" and "10-50 no injuries"
so I think they'd avoid the alphabets. Reminds me of when they tried out
the metric system many moons ago and quickly dropped it. "Suspect is 168cm
tall, 85 kilograms...". I could envision the cops with their calculators
furiously punching buttons, figuring out what the hell that means in english.
I wonder how much chaos that caused in the short span of time they used it.

Hmm sounds a little Biased to me! or maybe just plain >stupid! And don't give me any BS about how great AOL is, I was a user >for a while until I found that they would never travel at 28.8 in this >century!

First of all Jeff, I have accounts on six different networks and I just happened to be on AOL the night I decided to post on the Net. Not that it's any of your business what I spend a month for a net server but spending ten times the amount you quoted a month wouldn't bother me (not that it makes a flip). As for not being brilliant, I just happen to have 22 years of experience in electronics and communications, I happen to own several businesses and I have at one time or another worked for General Electric, United Artist, Pan Am and NASA (not that that makes a flip either).

Now if I understand you correctly, you work for Radio Shack is that right? Must be at least a couple of months judging from the content of your post. Maybe you'd have better luck posting in alt. rec. 17 year old with pimples. Everybody's got to start somewhere. Let me know when you get up to speed with the rest of us. I can always use a good laugh.

Have a nice day!

My experience with the AOR 1000XLT was mixed. It was good above 30 MHz. The ShortWave was terrible. Your better off getting the AOR 1500XLT. Has better AM ShortWave Reception and also comes with SSB. That's My Opinion - I've owned both.

Dave,

I doesn't work that way. Portable radios operate on whatever freq they are programed to. If my service is licensed on 155.280, I tell the dealer that when I perchace the radios and that is how they are programed.

FOR SALE: GREAT for portable ham packet radio, BBSing, Internet, device programming, desktop radio or scanner control use.....

Original NEC UltraLite notebook computer:

4.4 pounds with 2 new batteries

V-30 processor @ 9.83 MHz

640 K or RAM

2400 Baud Hayes compatible internal modem

Backlighted LCD screen (CGA)

1 MB of internal storage (RAM disk backed up by battery)

DOS v3.3 on ROM (also includes LapLink, SETUP util and MicroSoft File Manager)

New - Refurbished unit in original box w/90 day NEC factory warranty.

With power supply/battery charger, serial cable, documentation,

Also included: software - excellent mini communications pgm with embedded Z-modem only 35K, LapLink, many utils. You'd be surprised what you can get on a 1 M silicon hard drive if you try.

This setup is excellent for Ham packet radio, BBS/InterNet access and any data captured can easily be uploaded to another machine using LapLink which is included. Its also very suitable to portable use to program radios, cellular phones, word processing, spreadsheet, etc. ROM cards are available (Cheap!) from DAK with Lotus 1-2-3, WordPerfect, Agenda, and more.

Sell complete including shipping for $250.00

If interested send e-mail message to:

Well! I was beginning to wonder if anyone except me had bought a 2029!

I don't know of any mods, but I got the complete service manual of this scanner from Radio Shack. It seems that the scanner uses all of the possibilities of the PLL... It should be switcheable from 68-88 MHz to 30-54 MHz for it's VHF/lo band, but the RF circuits are not there, so reception is null if you program it for 30-54... You'd need to hack a complete RF circuit for 30-54... (schematics are given in service manual).

The PLL is a custom made ASIC, by General Research Electronics, in Japan, but they wouldn't give me technical information on this chip, saying that only Radio Shack will and can give it. Problem is that in the documentation given by RS, some on the circuit's pins have names (S24/BP0, S25/BP1...), but are marked as not connected, their meaning being not explained... Shucks!

The chip is GRE-0811. GRE can be reached at 00-81-3-34-04-36-36. If you feel like trying!

Cheers!
Gilles.

I recommend the 39, it is hardware modifiable (took me 30 minutes, start to finish) and has the same ranges as the 51. It scans a bit slower and there's no service search, but the images fall in the right places for me so as not to interfere w/what I listen to.

REPAIR TIPS: BEARCAT SCANNER RADIOS |

Copyright 1993, 1994 by Bob Parnass, AJ9S |

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or |
publications which charge for service without permission of
the author. Free distribution is encouraged.]

Introduction |

The original Bearcat scanner line was manufactured by |
Electra of Cumberland, Indiana. In the mid 1980s, Uniden |
bought out the Bearcat scanner line and Uniden's first |
Bearcat scanner was the 800XLT model. |

Most of the models discussed in this article are |
base/mobile units made by Electra during the 1970s and |
1980s. Electra stamped all of its scanners with a |
manufacturing date code on the rear of the cabinet. The |
code is comprised of a single character (C = Cumberland, |
Indiana, P = Puerto Rico), followed by four digits denoting |
year and week the radio was built. For example, "P8422" |
denotes the radio was made in the Puerto Rico factory |
during the 22nd week of 1984.

Schematics and Parts Available |

Schematic diagrams may be obtained from Uniden/Bearcat's |
parts department, (317)842-2483. |

G & G Communications (telephone 716-768-8151) is a family |
owned company which repairs scanners and stocks parts for |
several older models, especially Electra/Bearcat and |
Regency brands. They are located at 9247 Glenwood Drive, |
LeRoy, NY 14482. |

Electronic Repair Centers in Franklin Park, Illinois |
(telephone 708-455-5105) has been repairing Bearcat |
scanners for several years. They charge a flat $45 repair |
rate for programmable and $30 for crystal scanners, and |
shipping is extra. Electronic Repair Centers will fix |
Regency scanners if they can obtain the parts. |

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, | BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem. |

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In two of the BC300 scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer | failed, causing the output of the supply to drop below the | level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. The 22uF/16V * capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

I recently replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated | IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden. |

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. | Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times. *

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints. |

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a | flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know

if this is a common problem. |

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition. |

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, | e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board. |

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem. |

Other Problems

Complaints of low audio output and occasional microphonics | in a Uniden/Bearcat 800XLT was caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

Anybody with enough money can buy a brand new scanner, but you can save lots of money if you get a good deal on a used scanner. Hamfests are probably the best place to find used radios, but you must be familiar with the equipment. Hamfests are repleat with older radios you won't see in today's catalogs.

At last count, there were over 70 scanners and monitor receivers of various brands in my collection. I purchase most of my receivers at hamfests or horsetrade with other radio hobbyists. This article describes a few of the FM receivers in my collection, and is not meant to be complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Several people have been pleased with Electronic Repair Center, in Franklin Park, IL, which repairs scanners for a flat fee. Call them at (708)455-5105 to find out their current rates. G & G Communications (telephone 716-768-8151) is another scanner repair company. This family owned company repairs scanners and stocks parts for several older models. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, | BCL, and BCU models, did not provide individual channel | lockout capability. Electra didn't use the term "scanner" | and instead called these innovative radios "business | receivers." Other models, like the SBE Sentinel, employed | a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar

Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series. Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Bearcat BC-101, Radio Shack COMP 100, and Tennelec MCP-1, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

Radio Shack scanners contain a reasonable number of features. All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. A few years ago, the Regency and

Bearcat scanner lines were purchased by Uniden, a Japanese company, and production was moved to Asia.

My favorite VHF/UHF receivers are the 300 channel Radio Shack PRO-2004, the newer 400 channel PRO-2005 and PRO-2006, and the ICOM R7000 and R7100. The ICOM models are more "communications receiver" than a conventional scanner.

Other favorites include the Bearcat 300 and 760XLT, Regency M400, and the Regency K500 (predates the M400), all of which include a "service search" feature.

For portable use, I prefer the Radio Shack PRO-43 and Uniden/Bearcat 200XLT.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

ICOM

R-7000: At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be

installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but has better IF filtering and contains front-end circuitry for VHF-low, VHF-high, and UHF bands. No aircraft band coverage. Three crystal filters. Front mount speaker sounds good. No rescan delay.

Bearcat 12 (Electra): One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

BC101 (Electra): First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC220 (Electra): 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC20/20 (Electra): A BC220 but with 40 channels. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store

feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC350 (Electra): 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

800XLT (Uniden): 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives

10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels.

BC100XLT (Uniden): Excellent 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): Excellent 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The

most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Radio Shack

PRO2004: Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio.

PRO2005: Radio Shack's top of the line scanner for 1989 and scanner of choice. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although there is no mobile mounting bracket available and the keyboard is not backlit. More

sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended.

PRO2006: Radio Shack's 1994 top of the line scanner. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended.

PRO34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to

radiate signals into nearby receivers.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO24: Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar:

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e.,

no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2526	10	X		yes	yes
FR2526	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

>on every channel.
>Anybody else with the same story please post!

I bought mine for $199 on sale, just before they pulled them off the shelves. I didn't like the beep either, so I cut the trace on the CPU board that controls the beep. No more beep! Also, like you, I didn't like the squelch tail after every transmission so I piggybacked a 118K SMT resistor on top of the 1Meg resistor that has to do with the squelch tail. No more annoying squelch tail! These mods took all of ten minutes at an ESD approved workstation.

For $199, 50 channels per second scan and 100 channels per second search, I can live with the double conversion.

If it's broke, FIX IT!

David

Greetings,

I recently posted modifications that could help you come to an
agreement with your PRO-51.

I think the '51 was a steal at $199, when it was on sale, but
questionable at its original price of (I think) $299. Yes, it does
have poor image rejection up high, but this falls under the Your
Mileage May Vary clause--the radio may be excellent in some areas,
useless in others.

For the record, DOUBLE CONVERSION is *NOT* the reason why a receiver
would have poor image rejection. It's because the receiver front-end,
especially when tuned high, like around 800-900MHz, really can't
reject a signal only 21.6MHz (with a 10.8MHz IF) away from the desired
signal. I don't fault the PRO-51 for having double conversion.

>want to release some secret info. He he he!)
> I'm 10-7 duty,

All you need to monitor CADRE is a CADRE number, a password and an
Ottawa Police MDT! The system uses propriety software written by
MDI/Motorola. As well as it's own Operating System and chipsets. I
believe that the system is running at 4800 baud but it could be
9600. All units have to sign-on to CADRE you can hear them say
their CADRE numbers when they sign on via voice radio. If the
CADRE system is anything like the in-house system then the officer
will then gain access with his password, as the CADRE number seems
to work like an e-mail address, but with a RTS two way connection.
The officer can also be sent messages (like email). So the only
way for sure to monitor CADRE is to join the Ottawa Police Service
only people in the comm centre or the computer centre can monitor
all the CADRE traffic. BTW Nepean and Gloucester have their own
BTW: the mainframes (in-house are DEC's running UNIX and Oracle.

Source record: 268107

Brett,

The demo accepts either Creative Lab's Soundblaster .VOC sound files (8-bit) or
8-bit binary files (2's complement data). This means your recordings
of the DTMF tones must conform to one these sound file types.

The REGISTERED version works with the following file types:

1) Creative Lab's sound files (.VOC)
2) Microsoft Windows RIFF WAVE files (.WAV)
3) Raw binary files (2's complement).
4) ASCII list of files to process.

and also includes other features the demo doesn't have.
Any questions, email me.

Yes, it was a steal at $199. It has images all over the place;
not just "high", but on VHF too.

>For the record, DOUBLE CONVERSION is *NOT* the reason why a receiver
>would have poor image rejection. It's because the receiver front-end,
>especially when tuned high, like around 800-900MHz, really can't

>signal.

It may not be the reason the unit has poor image *rejection* but the
by-product of the double conversion is that images are abundant in
places where you really don't want them to be. Triple conversion puts
the images way out of the band you're scanning, sort of compensating for
the negative effect of that wide "front end".

>I don't fault the PRO-51 for having double conversion.

It wouldn't do any good anyway :-)

From: dbarton@unix.cc.emory.edu
Message-ID: <36cghu$p0g@emoryu1.cc.emory.edu>
Source record: 268110

Just picked up the new Radio Shack catalog, and got a glimpse of the new Pro-2035. 1000 memories, 50 channel per second capability,otherwise seems to be the same specs as the 2006. Has anyone had any experience with these units? I pretty much have my heart set on a new Pro-2006, but cellular is not very important to me (but there are other thigs in that band that I listen to), and if the performance and computer interface capabilities are similar, I might go with the 2035.

Does anyone know if you can get similar memory capacity/scan speed with the 2006 if modified? I am in the process of pulling down the mods, but there are so many! (What a nice problem.)

Thanks.

2967. digital squelch?

Newsgroup: rec.radio.scanner

What is a digital squelch? I am familiar with PL-Tones/CTCSS, but I was told
that the radios on the frequency I am trying to monitor use a digital squelch
when openning up to transmit. Before a broadcast I do hear what sounds
like a "digital squelch" (I presume that's what it is), but how do I program
this into my ham radio so that the squelch will not open unless it receives
that digital squelch?

Thanks,

Marc Wollemborg

I do not know of any scanners that can reproduce cw broadcasts in
the form of tones that can be heard. Your scanner will lock on the
broadcast but all that will be produced at the speaker are a series of
dead carriers keyed out as the cw is being tapped out.
If you do hear morse code, what you are hearing is audio keying
on an fm carrier. It is like playing a tape recording on an fm station.
I certainlty wish that one of my scanners had the capability to pick up
CW because I would like to recieve two meter CW communications in my
area. Keep in mind that most of time cw communications are reserved for
the high frequency bands such as those below thirty megahertz. Most
scanners cannot pick up those frequencies anyway. If there are uhf or
vhf stations that you have an intention of listening to that are
broadcasting, you cannot expect to hear them unless you are within at
most 100 miles or so with lots of luck, good location, and killer antenna.

About the only morse code you'll hear on a scanner is a cw id from a
station. This assumes your scanner does not receive below 30 mHz and
you are not using an upconverter.

: Getting caught may be a different story, but then is it ok to make a
: silencer if you don't get caught. Just TRY IT! Congress's intent was
: simple, cellular calls are private, and your splitting hairs is not
: withing the spirit (or the letter) of the law.

A couple of months ago I read in Mobile Radio Technology where a group at a wireless type convention demonstrated scanning cellular telephone frequencies with a legal scanner. The group demonstrated a modified OKI telephone that had the roms reprogrammed to add scanning. Legally, since the phone was still a phone, it was legal to use as a scanner. It seems the law does not address the issue of using a modified cellular telephone to scan, only a scanner. Earlier posts mentioned hacks described in Nuts and Volts magazine. If I remember correctly, the OKI phone uses and 8051 type processor. That means mucho information about the processor available and easy to read the roms. Cellular privacy is a ploy slammed on an unsuspecting customer in order to sell him a phone while giving him the illusion of privacy. Face it, a cell phone is a radio with a fancy computer attached to it. Since it's radio, somewhere someone is going to receive it and there is nothing the radio police will ever be able to do about it.

Hello Jim

I see you are just across the bay. I am in Jamestown and I am an serious scanner also. I use a PRO-43.

Anyway, do you monitor N.Kingstown Police? During their transmissions, occasionally they say go to channel 5. I cannot locate whatever channel 5 is. Do you have any frequencies for them???

Thanks in advance....Ric

Or shield the scanner. I had a Pro-2006 on my desk, fed by an antenna some distance away, with a coax feed. Didn't matter, the computers would periodically inject an incredible amount of hash into the scanner, apparently directly into the circuitry (since shorting the antenna input didn't make the noise go away!). I switched to a Pro-2004, which has a metal case but essentially the same circuitry - problem solved.

The "Wings Over Houston" air show will be coming to town in
October. One of the feature presentations is a demonstration
by the Confederate Airforce. It would be greatly appreciated
if someone out there could share some of the frequencies for
monitoring the Confederate Airforce air traffic communications.

Nope. The 2006 doesn't have vacuum tubes, just that luminescent type
of display. Your scanner works fine, and now receives much less
interference.

I haven't seen it yet in any Radio Shack. I heard its been delayed, and
should be out in mid-October. Probably, the main differences between it
and the 2006 is it scans faster, has a larger memory (ten 100 channel
banks/1000 channels), and in all likelyhood will not be modifiable.
If not having cellular means nothing to you, you might as well wait to
buy one. But if you want a scanner with continuous coverage (except
in the UHF TV band between 520 & 760 MHz) and don't mind a slightly
slower scanner speed, then try finding one of the remaining 2006's.

:

Are you looking for general "generic" equipment, or stuff that will put
you out nearly 30k ?

For generic items, give Radio Engineers a call. Phone is 619-565-1319.
They are in San Diego, CA They have handheld units for around $140..

For the most technolgically advanced, ultimate direction finding
equipment, give a company in Cave Creek, AZ. a call. Their name is
Doppler Systems, and they have specific finding equipment depending on
the frequency you wish to track. Their number is 602-488-9755.

About Doppler Systems' items: There was an article in "Police" magazine
about a mad search in California for a person who's radio kept breaking
squelch to the point where it was tying up radio traffic.

A Sheriff's Reservist and Amateur Radio Operator found some equipment in
the basement of one of their precincts. He found out that it was (after
reading the manual) that it was DF equipment that has been sitting unused.

He mounted it on one of the Sheriff's Department's vehicles (Chevy
Suburban, if I remember correctly) and eventually found out that it was a
Deputy's portable HT that had a shorting PTT switch on his speaker/mike.

This DF equipment was (according to the article) purchased from Doppler
Systems.

Hope this helps.....

2984. AR8000 problem (frontend overloading or AGC?)

Newsgroup: rec.radio.scanner
Date: 1994-09-29 01:40:47 UTC
From: kohn@ICSI.Berkeley.EDU
Message-ID: <36d5v0$5pp@agate.berkeley.edu>
Source record: 268044

I just got an AR8000, and overall I am impressed
with it. (I can't wait to get the RS232 interface
so I can download frequencies directly!)

The major problem I have with it seems to be
some sort of front-end overloading or AGC problem.
For example, a frequency that has both strong and weak
signals will have no trouble with the weaker signal,
but when the stronger one comes on, the audio seems
to blank out during the peaks. This happens
even with the antenna removed and the internal 10db
attenuator turned on.
Opening up the squelch all the way
(so that it will play the background static) makes
the problem go away. The manual says something about
the simplified AGC circuit compared
to larger base stations such as the AR3000A.
I have not played with all of the parameters
that can be changed by holding down buttons when
it is turned on. Does anyone know if there is some
way to control parameters of the AGC such as
the attack adjustment rate, etc. ?

I have not had enough time yet to write a complete
review. Already I like it better than the MVT-7100,
Trident-2400 (my previous favorite) or BC2500XLT.

Thanks
Phil Kohn

```
THE RADIO SPECTRUM
------------------

This is an approximate look, to help in searching frequencies on a
scanner or shortwave radio. Just be aware, having the right frequency
may not be enough, in tuning to a certain frequency. The time of
day, atmospheric conditions, location, mode you're in (AM, SSB,
Narrowband FM, Wideband FM, etc.), or your equipment, are also equally
important. You'll find most transmissions are broadcasted in Narrow-
band FM. Some main exceptions are shortwave (AM & SSB), commercial AM
radio (AM), commercial FM radio (Wideband FM), television (Wideband FM),
citizens band radio (AM & SSB), and aeronautical communications (mostly
AM). Most all scanners will pick a default mode for you, depending on
what frequency band you are in. But many scanners also let you manually
switch between modes (AM, FM, etc.) if the default mode isn't correct.
Happy Listening!!!

FREQUENCY USES/SERVICES
(in Megahertz unless
otherwise indicated)
---------------------- ------------------------------------------------

10 - 150 kHz Military/government, submarine
(.01 - .15 MHz) communications.

150 - 535 khz Longwave Band, beacons, foreign broadcasts,
(.15 - .535 MHz) maritime.

535 - 1700 khz Your standard AM radio dial.
(.535 - 1.7 MHz)

1.7 - 30 Shortwave/High Frequency Band. Broadcasting,
two-way government, military and commercial
communications, amateur radio, CB radio (approx.
27 MHz), others.
Shortwave - Approx. Range Meter Band
1.8 - 2.0 160*
2.3 - 2.495 120
3.2 - 3.4 90
3.5 - 4.0 80*
3.9 - 4.0 75
4.75 - 5.06 60
5.9 - 6.2 49
7.0 - 7.3 40*
7.1 - 7.35 41
```

9.4 - 9.9 31
10.1 - 10.15 30*
11.6 - 12.1 25
13.57 - 13.87 22
14.0 - 14.35 20*
15.1 - 15.8 19
18.068 - 18.168 17*
17.48 - 17.9 16
18.9 - 19.02 15
21.0 - 21.45 15*
21.45 - 21.75 13
24.89 - 24.99 12*
25.6 - 26.1 11
28.0 - 29.7 10*
(In general, the lower shortwave frequencies
<higher meter band> are received better during
the night, while higher frequencies are re-
ceived better during the day. There are also
some amateur radio bands between many of these
shortwave bands(*). Consult a shortwave guide
for more detailed information.)

30 - 50 Very High Frequency Band. Government, business,
walkie-talkies. Also, cordless phones and
'baby monitors' found about 46 - 49 MHz.

50 - 54 Amateur radio 6 meter band.

54 - 72 TV Channels 2-4.
Channel 2 Audio (Wideband FM) 59.75
Channel 3 Audio (Wideband FM) 65.75
Channel 4 Audio (Wideband FM) 71.75

72 - 76 Manufacturing, remote control, eavesdropping
bugs, etc.

76 - 88 TV Channels 5-6.
Channel 5 Audio (Wideband FM) 81.75
Channel 6 Audio (Wideband FM) 87.75

88 - 108 Your standard FM radio dial.

108 - 136 Aeronautical communications (AM).

136 - 138 Satellites.

138 - 144 Military communications.

144 - 148 Amateur radio 2 meter band.

148 - 150.8 Military use.

150.8 - 174 Business, highway, law enforcement, government
weather, maritime.

174 - 216 TV Channels 7-13.
Channel 7 Audio (Wideband FM) 179.75
Channel 8 Audio (Wideband FM) 185.75
Channel 9 Audio (Wideband FM) 191.75
Channel 10 Audio (Wideband FM) 197.75
Channel 11 Audio (Wideband FM) 203.75
Channel 12 Audio (Wideband FM) 209.75
Channel 13 Audio (Wideband FM) 215.75

216 - 220 Maritime and aeronautical.

220 - 222 Land mobile communications.

222 - 225 Amateur radio.

225 - 400 Military aviation and space.

400 - 406 Military and government.

406 - 420 U.S. Government.

420 - 450 Amateur radio.

450 - 470 Ultra High Frequency Band. Business, industry, military, fire government.

470 - 512 TV Channels 14-20, shared with law enforcement.

512 - 825 TV Channels 21-69.

825 - 849 Cellular telephones (receivers/handsets).

849 - 851 Aeronautical telephones (handsets).

851 - 866 Business, public safety, trunked systems.

866 - 869 Public safety, law enforcement, trunked systems.

869 - 894 Cellular telephones (towers).
Note: Even though listening to cellular telephone calls is technically illegal in the United States, one will usually do better listening to calls on the tower frequencies, as opposed to the handset frequencies. This is because most cellular phones transmit less than one-watt of output. So unless the cellular phone is very close to you, you will have much more luck scanning the more powerful towers, which transmit/receive for each cell site.

894 - 896 Aeronautical telephones (ground-based towers).

896 - 901 Private land mobil units.

902 - 928 Land mobile, amateur radio, personal communication units, portable telephones.

928 - 932 Radio Paging.

935 - 940 Business Radio.

941 - 944 Government and non-government fixed services.

944 - 952 Broadcasters' studio-to-transmitter links.

952 - 960 Private fixed services, paging.

960 - 1240 Aeronautical navigation.

1240 - 1300 Amateur radio.

1300 - 1350 Aeronautical navigation.

1350 - 1400 Radio location.

1400 - 1427 Radio astronomy.

1427 - 1429 Point-to-point, mobile, space.

1429 - 1660.5 Various satellite transmission uses.

1660.5 - 1668.4 Radio astronomy.

1668.4 - 1700 Meteorological aids.

1700 - 1850 Meteorological satellites, U.S. Government.

1850 - 1990 Fixed point-to-point, microwave.

1990 - 2110 Broadcast studio-to-transmitter links.

(end)

2986. 900Mhz cordless question

Newsgroup: rec.radio.scanner
Date: 1994-09-29 02:32:37 UTC
From: dretzik@uoguelph.ca
Message-ID: <36d905$116@nermal.cs.uoguelph.ca>

I pose one question:

-How far away can a scanner be detected?

if anyone understands how or why they can be detected, please explain, thanks.
Like, why a scanner actually transmits, and what equiptment is needed to
detect them.

Cross-posted to: rec.radio.scanner,rec.radio.shortwave

I've discovered that I have the original box/packing material &
carrying strap + earphone for a Fair Mate HP-2000 wideband handheld
receiver which I no longer own.

Instead of just throwing out the box, I was thinking that there
might be someone out there who has an HP-2000, but no box.

If you have a need for the box, send e-mail. I'd want about $5
for UPS shipping.

Tim

>control until the inverted signal is restored.

Jerry, Michael was asking how to use the descrambler. The descrambler simply plugs into your audio output jack. I think you got the question confused with how to *receive* or *descramble* a frequency inversion signal. If you don't have the descrambler, then your method is worth a try (although I haven't had much luck with it yet). I've heard of people doing this but I can't get an intelligible signal with my DX-440 or my Yupi on the inversion scheme the cab company uses. The descrambler works fine. Could it be that there is more than one freq inversion scheme and only one type is detectable in the manner you describe?

I noticed in the catalog that it also omits the base side of the Airphone
band but the airplane side (894-896) is available. So you should be able
to scan those phone calls from the sky with the 2035 in 5KHz steps, AM :-)

You're probably referring to the digital signal that the Motorola Radius radios or similar units use. It is used in the same manner as PL-Tones but there are many more possible settings. I would imagine it would be quite a job rigging a scanner to these. Maybe not. I know several folks who added CTCSS so maybe it is a similar add on.

Comments from a friend who has an advance sample:

1. Cellular frequencies come in loud and clear in the low 1100 MHz band.
2. The attenuator does almost nothing.

Of course, the typical useless "review" in MT mentions none of these.
They say it performs electrically like the PRO-2006 which seems to be
anything but true.

These are reversed. 894-896 is the airplane handset and generally the only thing you can pick up unless you're near a ground transmitter.

Most of these phones are digital signals (not analog) so they will sound
like white noise or static. If your scanner does stop in that band and
you hear a signal of what appears to be the squelch breaking for no good
reason, you've probably stumbled on a 900 MHz phone!

John Allds wrote:

> A friend just gave me a Yagi directional antena.......

Yagi antennas, properly called Yagi-Uda parasitic arrays, are highly directional antennas that offer high gain; the greater the number of elements in the antenna, the greater the gain and directivity. The typical configuration is one driven element, one reflector element, and any number of director elements, up to 10 or so. Yagi's also offer very narrow beamwidths (again, as a function of the number of elements). So to use a yagi for monitoring, you have to be able to aim the antenna at the station you wish to hear. Yagis with 10 elements or so can offer 8 to 10 db of gain, or about 1 to 1.5 "S" units. I don't know just how much it will help with monitoring at VHF and higher frequencies, as range is determined more by terrain than by power and gain considerations. If you want to give it a try, install it pointing toward some station you want to monitor, or use a rotator of the type intended for TV antennas. Overall, my guess is that you would be much better off with a good omni-directional antenna. Best of luck. P.S.: be sure to use high-quality coax transmission line, as even good coax is pretty lossy at frequencies above VHF; cheap coax is very lossy, and over a long coax run (50-100 ft) can easily offset any gain you get from the antenna.

First, before I get rolling here, let me point out something. Please DO NOT take this post as a flame, I certainly don't intend it that way...

In article <36cv72$b37@glock.ramp.com>,
rrk@glock.ramp.com (Richard Kendrick) wrote:

> A couple of months ago I read in Mobile Radio Technology where a group
> at a wireless type convention demonstrated scanning cellular telephone
> frequencies with a legal scanner. The group demonstrated a modified
> OKI telephone that had the roms reprogrammed to add scanning. Legally,
> since the phone was still a phone, it was legal to use as a scanner. It

Good people, when I read messages (and magazine and newspaper articles) that say stuff like this, it becomes obvious that a lot of people on here have never actually READ the ECPA of 1986.

If you "intercept" a cellular phone call that you are not a part of, and you do NOT work in the cellular phone industry (and even then such interception has to be a routine part of your job) it is against the law, according to the ECPA of 1986, for you to be listening to that call. It does not matter what your equipment is. You can be using two soup cans and a piece of string, you can be using a cellular-capable scanner that required no mods, you can be using a scanner that you modified yourself, you can be using a cellular phone that can be made to scan, you can be using the front bumper of a '57 Chevy attached to a piece of wire for all that law cares, and you are STILL in violation of the ECPA. The only exception is if you are a law enforcement agent *WITH A COURT ORDER*, or you are employeed in the cellular phone industry and such interception is part of your day-to-day job. THERE ARE NO OTHER EXCEPTIONS!

I would further like to point out, that the ECPA only uses the word "cellular" twice, and its a 35 page long document! The word "scanner" or "scanning receiver", or its other variations, NEVER APPEARS. The ECPA also does NOT specify any specific frequency ranges...at no point does it say "thou shalt not listen to 872.xxx".

I'm not trying to tell people not to listen to cellular phone calls, what you listen to is your decision. Every scanner I own has been modified to pick up cellular. And, as I have pointed out in atleast 6 other messages, I am NOT an attorney, so please don't take my messages as legal advise. But when I am knowingly breaking a law, which is something I am doing when ever I listen to a cellular phone call, I atleast try to be very familiar with what laws I am breaking! Hence, I have read the ECPA **VERY** thoroughly.

I used to offer to email the text of the ECPA to anyone who asked. Then I discovered that anyone with access to Veronica or Jughead can find it in

atleast fifty places on their own, without me distributing it also. Just point Miss Veronica at "ecpa" and you should find atleast fifty copies of the damned thing. But if you still can't find it, send me email and I'll send you back a copy.

David
davidm@iglou.com

P.S. Is there a FAQ on cellular phone scanning and the law yet? If not, maybe I'll try to get one started...

RadioMap Service Expands into
Ohio, Pennsylvania, Missouri

by Bob Parnass, AJ9S

As someone involved in solving radio and TV interference
problems, I've spent a lot of time identifying the
transmitting antennas and towers I see in my travels. An
FCC database is useful, but the transmitter site information
is either vague or incorrect.

Over 15% of the FCC licenses, including many fast food
restaurants, contain transmitter latitude and longitude but
specify no transmitter city. To determine the location of
those transmitters requires using the latitude and longitude
information.

I developed a process which produces a color map of FCC
licensed and selected FAA transmitter sites in an area,
given a center location (latitude/longitude) and a range (in
miles). I call this new innovation a RadioMap(TM). It
allows you to identify antenna sites (including paging and
cellular phone cell sites) and visualize the transmitter
locations in your neighborhood, around your office, near
your repeater, at an airport, and other places of interest
-- from VLF through microwave.

A map of local transmitter sites is very useful when solving
intermod problems and is of interest to scanner buffs, too.

Streets, rivers, and ham radio stations are not shown as
they would clutter the RadioMap. RadioMap includes key
sheets which list frequencies, callsigns, and licensee
names. In rural areas, ranges of up to 10 miles are
possible, while ranges of 1/2 to 2 miles produce best
results in urban cities.

Currently, I produce custom color 8-1/2" by 11" RadioMaps,
suitable for framing or laminating, only for areas in:

Illinois
Indiana

Michigan
Missouri
New York
Ohio
Pennsylvania
Wisconsin

Watch for future announcements as new states are added.

Send $19.95 ($16.95 + $3 for shipping & handling) for each
color RadioMap, your name, address, and telephone number,
along with center location (lat/long or nearest intersection
of 2 streets) to: Bob Parnass, 2350 Douglas Road, Oswego, IL
60543. tel. (708)554-3839 6-10 PM central time.

You might want to try an "active" antenna, one with an amplifier built into the antenna with the DC power supplied over the coax. I use an active antenna made by Diamond with an ICOM R7000 with great results. It has a variable 20db gain and 30 to 1000Mhz bandspread. It is used indoors as I live in an apartment building. It cost around $170.

3017. Mobile scanners & antenna...

Newsgroup: rec.radio.scanner
Date: 1994-09-29 18:27:20 UTC
From: woody@netmaster2.hq.af.mil
Message-ID: <36f0u8$gp2@hq.hq.af.mil>
Source record: 268060

Anybody have any suggestions on mobile scanners? I am thinking of installing one this weekend, but, honestly, I don't have a clue as to what would be a good buy.

Also, I know there are adaptors on the market that allow you to split your connection to your radio antenna, and I am curious as to how well this works for general freq's (police, fire). I am not at all concerned about receiving high (800+) freq's.

Any suggestions are appreciated!

Thanks!

Woody

It seems as though Bob's review was done without the scanner since they were not released until after he did his review. His review included errors in the that did not agree with actual operation. It seems it was done based on the manual specs which included some errors.

Early reports indicate that its not worth the money. Performance is worse (RF sensitivity) and the search and store feature in "dumb" - it will store the same freq into all channels (usually a birdie). No computer interface, and you have to lockout all unsed channels by hand (remember 100ch per bank).

A few months back, I saw a PBS documentary on Whooping Cranes and noticed some Cranes were carrying radio transmitters used for tracking beacons.

I would like to find out the frequency that is used. In addition, the time of the year and approximate paths during migration.

Thanks.......73, Gary....K5WWQ.

>attenuator turned on.

Usually, when the signal cuts out on the peaks it is due to improper bandwidth setting. A signal with a wider bandwidth will cut out on the peaks since the frequency deviation causes the signal to be attenuated by the filter. It is possible that the filter is too narrow for what you are listening to.

FOR SALE
--------

REALISTIC 50-CHANNEL SCANNER - $100
-----------------------------------
Model PRO-2028 ($159.99 new). 50 channels plus 5 search channels.
29-54MHz, 108-174Mhz, 406-512Mhz. One-touch weather button.
Dual conversion receiver. Search, scan-delay, lockout, priority.
Memory backup. External antenna jack. External speaker jack.
110VAC or 12VDC with optional cord. 8 months old. With whip antenna and manual.

REALISTIC 400-CHANNEL SCANNER - $300
------------------------------------
Model PRO-2006 ($399.99 new). 400 channels plus 10 search channels. 29-520MHz,
760-823Mhz, 851-868Mhz, 896-1300Mhz. Cellular mod done. 2-speed search: 13 or
26 per second. Higher-speed scan mod done. Selectable narrow-FM, wide-FM, AM.
Selectable 5KHz, 10KHz, 30KHz steps. Triple conversion receiver. Zeromatic
tuning. Sound squelch. Search, scan-delay, lockout, priority. Memory backup
(with 9V battery). External antenna jack. External speaker jack. Headphone
jack. Tape record jack. 110VAC or 12VDC with optional cord. 4 months old.
With whip antenna and manual.

Shipping negotiable. Prices negotiable. Both units in excellent shape. I
just got a PRO-43 handheld, and another PRO-2006, so I don't need all 4 (I
really don't need any). :)

Bzzzt...but thank you for playing. Please select another category.

AM and FM are modulation methods, not frequency bands as in common usage. ATC comms are AM for two reasons:

1) Historical - aircraft have used AM from the beginning and changing over now would be a royal pain in the rear.

2) Capture effect - with FM, the strongest signal wipes out all other signals, while with AM multiple signals can be heard on one frequency. This prevents a stuck transmitter on an aircraft from completely wiping out comms on that frequency, and ATC can recognize when two aircraft transmit simultaneoulsly.

You can check this out with a scanner that switches from AM to FM in any frequency range (e.g. Pro-43). Select FM in the 118-136 band and you won't get squat.

3030. Regency 1040 Question

Newsgroup: rec.radio.scanner
Date: 1994-09-29 22:28:00 UTC
From: rbn@apple.com
Message-ID: <36ff1g$eef@apple.com>
Source record: 268071
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I have a Regency 1040 scanner with a bad memory. :-) It'll accept a frequency entered into the VFO, but if I try to write that frequency to memory and scan the frequency is gone. I'm guessing it's a bad RAM chip, but without opening up the case I can't be sure.

I'm hoping someone here is familiar with the 1040 (a schematic?) and can suggest whether there is in fact a discrete RAM chip...and exactly what chip that would be. :-)

Any help is appreciated.

rbn@apple.com

The AR1500 is an 1000 crammed into a smaller case, with poorly-implemented (analog BFO) SSB and a useless auto-store feature. It has poorer sensitivity, poorer audio, and poorer battery life than the AR1000XLT. I have Howard Bornsteins comparative review online here if anyone wants a re-post.

I will not suggest any makes or models for you because everyone has different needs but heres the general idea about the freqs.

The spec. 150 khz to 30mhz is what mose people refer to as Low Frequency and High Frequency (LF/HF)

These are the bands where you listen to the world. Shortwave broadcasting and utility stations (coast guard military ships and planes from far away.)

This forum is prety much for those who are interested in frequencies above 30 mhz.

The 30mhz to 300mhz band is generically called VHF for Very Higf Frequency and 300mhz to 3000 mhz (is the UHF or Ultra High frequencies)

Frequencies above 30 MHZ do not generally cover the world. They are the places that you hear police/fire/cellular etc etc.

I hope this helps.

steve out

PS: (The 7100 for sure ;-)

3035. NEW PRO-51 Board to improve reception?? Any heard of it?

Newsgroup: rec.radio.scanner

From: Jennifer Day-Elgee <elgeej@news.nbnet.nb.ca>
Message-ID: <36fjsf$ara@darwin.nbnet.nb.ca>
Source record: 267986

My local RS dealer claims that in Canada they are coming out with some kind of board (he called it a "tone board") that will improve reception on the PRO-51 and help get rid of the images.

My question is this....has anyone else heard of this board? Is he joshing me? I am considering trading in the '51 for the PRO-43, if I like it. I guess its a great scanner, but doesn't scan or search as fast as the PRO-51.

I would appreciate anyone e-mailing me the PRO-43 mod for cellular.

Thanks.

Jennifer

Below is the Radio Spectrum list I compiled from a couple of magazines.
I've corrected a couple of errors that were called to my attention.
You are free to do what you want with it: Print it, rip it, or burn it.

Berton Corson
Northridge, California

THE RADIO SPECTRUM

This is an approximate look, to help in searching frequencies on a scanner or shortwave radio. Just be aware, having the right frequency may not be enough, in tuning to a certain frequency. The time of day, atmospheric conditions, location, mode you're in (AM, SSB, Narrowband FM, Wideband FM, etc.), and your equipment, are also equally important. You'll find most transmissions are broadcasted in Narrow-band FM. Some main exceptions are shortwave (AM & SSB), commercial AM radio (AM), commercial FM radio (Wideband FM), television (Wideband FM), citizens band radio (AM & SSB), aeronautical communications (mostly AM), and some military VHF/UHF (Wideband FM). Most all scanners will pick a default mode for you, depending on what frequency band you are in. But many scanners also let you manually switch between modes (AM, FM, etc.) and frequency search spacing (5 khz, 12.5 khz, etc.) if the default modes are not correct. Happy Listening!!!

FREQUENCY USES/SERVICES
(in Megahertz unless
otherwise indicated)
---------- ----------

10 - 150 khz Military/government, submarine
(.01 - .15 MHz) communications.

150 - 535 khz Longwave Band, beacons, foreign broadcasts,
(.15 - .535 MHz) maritime.

535 - 1700 khz Your standard AM radio dial.
(.535 - 1.7 MHz)

1.7 - 30 Shortwave/High Frequency Band. Broadcasting,
two-way government, military and commercial
communications, amateur radio, CB radio (approx.
27 MHz), others.
Shortwave - Approx. Range Meter Band
1.8 - 2.0 160*
2.3 - 2.495 120

3.2 - 3.4 90
3.5 - 4.0 80*
3.9 - 4.0 75
4.75 - 5.06 60
5.9 - 6.2 49
7.0 - 7.3 40*
7.1 - 7.35 41
9.4 - 9.9 31
10.1 - 10.15 30*
11.6 - 12.1 25
13.57 - 13.87 22
14.0 - 14.35 20*
15.1 - 15.8 19
18.068 - 18.168 17*
17.48 - 17.9 16
18.9 - 19.02 15
21.0 - 21.45 15*
21.45 - 21.75 13
24.89 - 24.99 12*
25.6 - 26.1 11
28.0 - 29.7 10*
(In general, the lower shortwave frequencies
<higher meter band> are received better during
the night, while higher frequencies are re-
ceived better during the day. There are also
some amateur radio bands between many of these
shortwave bands(*). Consult a shortwave guide
for more detailed information.)

30 - 50 Very High Frequency Band. Government, business,
walkie-talkies. Also, cordless phones and
'baby monitors' found about 46 - 49 MHz.

50 - 54 Amateur radio 6 meter band.

54 - 72 TV Channels 2-4.
Channel 2 Audio (Wideband FM) 59.75
Channel 3 Audio (Wideband FM) 65.75
Channel 4 Audio (Wideband FM) 71.75

72 - 76 Manufacturing, remote control, eavesdropping
bugs, etc.

76 - 88 TV Channels 5-6.
Channel 5 Audio (Wideband FM) 81.75
Channel 6 Audio (Wideband FM) 87.75

88 - 108 Your standard FM radio dial.

108 - 136 Aeronautical communications (AM).

136 - 138 Satellites.

138 - 144 Military communications.

144 - 148 Amateur radio 2 meter band.

148 - 150.8 Military use.

150.8 - 174 Business, highway, law enforcement, government
weather, maritime.

174 - 216 TV Channels 7-13.
Channel 7 Audio (Wideband FM) 179.75
Channel 8 Audio (Wideband FM) 185.75
Channel 9 Audio (Wideband FM) 191.75
Channel 10 Audio (Wideband FM) 197.75
Channel 11 Audio (Wideband FM) 203.75
Channel 12 Audio (Wideband FM) 209.75
Channel 13 Audio (Wideband FM) 215.75

216 - 220 Maritime and aeronautical.

220 - 222 Land mobile communications.

222 - 225 Amateur radio.

225 - 400 Military aviation and space.

400 - 406 Military and government.

406 - 420 U.S. Government.

420 - 450 Amateur radio.

450 - 470 Ultra High Frequency Band. Business, industry,
military, fire government.

470 - 512 TV Channels 14-20, shared with law enforcement.

512 - 825 TV Channels 21-69, others.

825 - 849 Cellular telephones (receivers/handsets).

849 - 851 Aeronautical telephones (ground-based towers).

851 - 866 Business, public safety, trunked systems.

866 - 869 Public safety, law enforcement, trunked systems.

869 - 894 Cellular telephones (towers).
Note: Even though listening to cellular
telephone calls is technically illegal in the
United States, one will usually do better
listening to calls on the tower frequencies,
as opposed to the handset frequencies. This
is because most cellular phones transmit less
than one-watt of output. So unless the
cellular phone is very close to you, you
will have much more luck scanning the more

powerful towers, which transmit/receive for
each cell site.

894 - 896 Aeronautical telephones (handsets).
Note: In scanning airplane telephones, you
will usually do better listening to the handset
frequencies, instead of the tower frequencies,
unless you are very near a ground transmitter.
But, in any event, call traffic heard on handset
frequencies is very scant.

896 - 901 Private land mobil units.

902 - 928 Land mobile, amateur radio, personal communi-
cation units, cordless telephones.

928 - 932 Radio paging.

935 - 940 Business radio.

941 - 944 Government and non-government fixed services.

944 - 952 Broadcasters' studio-to-transmitter links.

952 - 960 Private fixed services, paging.

960 - 1240 Aeronautical navigation.

1240 - 1300 Amateur radio.

1300 - 1350 Aeronautical navigation.

1350 - 1400 Radio location.

1400 - 1427 Radio astronomy.

1427 - 1429 Point-to-point, mobile, space.

1429 - 1660.5 Various satellite transmission uses.

1660.5 - 1668.4 Radio astronomy.

1668.4 - 1700 Meteorological aids.

1700 - 1850 Meteorological satellites, U.S. Government.

1850 - 1990 Fixed point-to-point, microwave.

1990 - 2110 Broadcast studio-to-transmitter links.

(end)

Here is what I have. I own a PRO-2006 and PRO-2030, and have done mods
on both of them. But from what I've heard, the newer PRO-2030's lack
the diode/jumper marked L201. I don't know if these units can be modified.
Bert

****

Modification to restore cellular frequencies in the Radio Shack PRO-2030
Scanner. Please be aware that listening to cellular is supposedly
illegal in the U.S. This mod is solely being posted just to restore
the full 800 mhz coverage that the scanner was originally designed for.

This mod is essentially the same as the PRO2026 except the location of the
jumper is slightly different.

1. Remove power cable.
2. Turn unit upside down.
3. Remove five (5) recessed screws from bottom panel.
4. Carefully remove bottom panel.
5. With display panel facing you, locate the jumper marked L201 on the
circuit board attached to the display. It will be about
2" in from the from and 2" in from the right side. It will look
like a RF coil.
6. Cut the jumper marked L201.
7. Reinstall the bottom and reconnect power. Scanner is ready for use.
8. Cellular frequencies are now restored with 30 Khz channel spacing.

Please note: I picked up this mod from the FIDO net. I have never
completed the mod myself because I own the 2006. But I do have the
service manual and this is the diode that locks out the cellular band.
Even the specs show this diode connected to pin 10 of the microprocessor.
This pin is the STRAP OPTION CELLULAR SKIP. Too easy!

"Linear RAdios"??? Spoken as only a Radio Shaq manager could! I guess,
since they are illegal, RS only sells non-linear radios!

The FCC doesn't really care about how strong the transmitter is --
it should be strong enough to not fall apart like the crap RS sells.
The "FCC rules and regs" set limits on Electric Field Strength (measured
in volts/meter) and/or Transmitter Power (measured in watts).

Jeff supports the supposition that RS only hires people who haven't
got a clue what they're talking about, but can BS their way past most
customers with the official RS Technobabble. That strategy doesn't work on
the Net.

i can get my stuff programmed for free. however, i can't get copies of
the software, mainly due to the dealer i know being worried about it's
spread through the underground.

as far as programming icom's goes, if it's an H16 or U16, it's very
easy...

holding down the function key on the radio, enter 1 5 9 3 5 7

when you let go, a ":" should appear between the "ch" and the channel #
on the display. you are now in program mode.

holding down <function> and pressing 5 displays the receive/transmit frequency for the channel you are on. you have to continuously hold down the function key while you are entering a new frequency. all digits in the frequency need to be entered. be sure to press <ent> before letting go of the function key to enter the frequency into memory.

you are in program mode so long as the : is on the screen.

to enter the CTCSS transmit tone, press <function> 1. this will display the current tone (u need icom's numeric chart...sorry, i don't have it). enter the tone # and press <ent> to continue. <function> 2 is the receive tone.

to enter in a repeater offset, press <function> 4. the display will show you the current offset. use * for a negative offset, # for a positive offset, followed by the offset value in MHz (+5MHz for 440-470, +3MHz for 480-495, no standard for VHF on the H16 though). 5MHz would show up as 05 00 on the display while 600kHz would show up as 00 60 on the display. again, be sure to enter in all digits, then press <ent> to accept the new value.

to enter in a special channel # (not more channels than 16, just a different # to label a channel with than 1-16), presss <function> 7.

i think <function> 8 is a time out timer option. never use the thing myself. keeps you from keying the radio for over 2 mins or something like that.

<function> 9 is transmit inhibit. you'll know if this is active because the TX indicator won't come on when you key the radio. great for entering in the local police and fire for monitoring purposes. keeps yo u out of trouble with the authorities.

remember, you can clone the 16 channel icom mobiles from an H16 or U16, just follow the instructions that come with the unit.

I have seen a mod to activate the cell range fro the Pro39, does it
still work with the current models. Should I look for a specific
manufacture date? I want to purcahse my first scanner and thought
the Pro39 would be a good choice, but I really want to make sure
that the mod works. :)

Any suggestions would be greatly appreciated! :)

I found a PRO-2006 at one of the local Radio Shacks here in lovly Phoenix Arizona.

After one night of letting my wife control the PRO-51 ... I convinced her to spend the $350 for the PRO-2006.

I just have one question -

What is the "ATT" switch on the back for? The manual says *nothing* about it.

Thanks.

ID>enough, I ended up buying a Pro-51. Lotsa fun! :)

ID>I am wondering if anybody has the freqs on which the Motorola HT600(?)
ID>operates
ID>on. If so, could you drop me a line through e-mail? Thanks.

ID>Dave
HT600, you're talking about anything from 140-174MHz up to 406-500
MHz or more...

either you need to find out what band the unit you're trying to listen
to operates on, or you better just set your scanner to search
everything. better yet, get a frequency counter...

vector@inferno.com
pretty broad spectrum you're talking about. is this a vhf unit or a uhf

Now should we beware of newer unmodifiable units or are older PRO-43s still available?

Best Regards, Keith

Sony 2010 - 3

I found it VERY easy to plug in and start listening. The supplied instructions are adequate for what they do, but are not really enough to really start enjoying the radio. The whip antenna works great at home, but just doesn't cut it at work (way too much metal/interference). Even the supplied wire antenna does not seem to help at work (I have not yet tried it at home (no real need).

****
Realistic DX-342 - 1

I've owned this little radio for about a year now and am really pretty happy with it.
